and a crash, and we rushed to render first aid. When we reached the scene there was no sign of the sportsman's machine, which was at the bottom of a concealed ditch, but its owner could be seen in the field peering through the barbed wire fence rather anxiously.

**Judges and Strawberries.**

It was on this run that the judges in the official car purchased a huge punnet of strawberries to eat *en route*. Finding they had over-estimated their appetite for fruit, they generously tossed the basket—still containing three or four pounds—to a small laddie by the roadside. The car was going fast, and the heavy missile hit the laddie on the temple. He went over as if he had been shot, and for the rest of the week the quartette shivered whenever they saw a policeman looking interested in them.

My friends sometimes wonder why I am not on speaking terms with a certain press photographer. It

A couple of riders rounding a bend on Silver Hill in the A.C.U. 1913 trial. The riders are K. A. Macdonald (3½ h.p. Singer) and A. Sumner (8 h.p. Zenith).

(Inset) Running through Threlkeld in the same trial. W. J. Sproule (3½ h.p. P. and M.) followed by H. W. Teeton (3½ h.p. James).

was thuswise. Advancing years, corporation, and reputation led to my being promoted to the proud position of an official, and riding in a real car with flags on it. One day the official car broke down on a particularly lonesome run; we were giving a courtesy lift to the aforesaid press photographer, who was particularly anxious to secure some snapshots on a famous hill a few miles further on. When the second official car came up, we sent the camera man on with them to the hill. It was late in the afternoon before we had completed our repairs, and we grew so hungry in the process that there was almost a squabble over the division of the camera man's luncheon; hotels, of course, were non-existent in these wilds. Towards 6 p.m. we reached the hill *en route* to the night garage, and there we found the press photographer, almost fainting. Relying on our skill in roadside repairs, he had disembarked there from the second car at 10 a.m., since when he had neither eaten nor drunk. He is a relentless, unforgiving man.

**More Sporting Reminiscences.—**

Here is a pathetic experience. I was well in the running for several special prizes, not to speak of the ordinary gold medal, towards the evening of the fifth day of a very important trial, when my jet choked in a perfect hurricane of rain and wind. I was using an experimental carburetter, with which I had experienced no trouble, and commenced to take it to pieces quite blithely, being well ahead of minimum time. I failed to notice that if the carburetter were dismantled in the ordinary way the jet would inevitably be torn off its socket, and this naturally occurred; nor had I a spare jet of any sort or kind. As my mishap occurred along a speed stretch, and the riders were all hurrying in to garage in a bad temper, I knew my chances of getting a jet of any sort were remote. The only thing was to try to stop every rider and borrow a jet of some sort, which couldn't possibly fit, but might be faked up. Marvellous to relate, I eventually got hold of a jet made for a very different carburetter, and by dint of much hammering got it jammed in place and reamed out to give an approximate mixture.

**Frightening the Ladies.**

On my very next trial my machine gave up hopelessly 150 miles from

headquarters. It had rained the whole of the morning, and was now thunderously hot. I had taken the entire engine to bits by the roadside, and was smeared with oil and grease and mud from head to foot, whilst my apparel was torn and disreputable to a degree. Moreover, owing to trouble overnight, I had not shaved for forty-eight hours. I succeeded in reaching a main line station after a long run across country, and staggered on to the platform just as a very fashionable holiday express pulled up. As the third-class carriages were all full, the guard pushed me into a first-class compartment, full of Vere de Veres in their society best, including two remarkably pretty girls. I never knew before how eloquently the inbred pride of centuries can twitch away a skirt.

(Top) Just over two years ago, but how long it seems! Outside the check at Stirling in the 1914 Scottish "six days."

(Middle) At the York control in the 1914 "London-Edinburgh."

(Bottom) Would a despatch rider grumble at the above "road"? We very much doubt it. The rider is J. Haslam (Premier sidecar) on Lee Hill, Shibden Dale, in the A.C.U. six days trial of 1914.

## — — — — —

## Lack of Petrol Licences.

**W**E are informed by the Petrol Control Committee that they possess a large number of postal orders which have been sent to them for petrol licences without a covering letter, and they are unable to trace them. This fact may account for want of attention, of which numerous motor cyclists have complained. Any of our readers who have sent postal orders and have not yet received a reply to their communications are requested to send the numbers of

such postal orders to the Petrol Committee, at the same time stating full details of their case. The matter will then receive attention.

Those who have not received their petrol licences in August may carry forward their August allowances to November; that is to say, a motor cyclist who did not receive his card last month entitling him to two gallons will be allowed to purchase this amount in November.

## Economical Management of a 3 $\frac{3}{4}$ h.p. Scott.

### SOME USEFUL TIPS BY A PRACTICAL RIDER.

THE specification of my Scott machine is as follows:

Frame, tank, gear, crank case, and wheels, 1912.

Cylinders, 1915.

Radiator, 1914.

Lubricator, 1916 B. and L. single drip feed.

Carburetter, 1916 Binks, with very ingenious quick starter, and hot air intake.

Magneto, Bosch ZF 2 type (two-spark).

This special magneto was lent me by Mr. Scott for the purpose of experimenting as regards the possible advantage of the two-plug system, and the various renewals above mentioned were also made for experimental purposes. The special magneto necessitated fitting a radiator which left room for the top plugs, the 1912 radiator coming too near the cylinder heads to permit the fitting of extra plugs in this position.

#### Value of Twin Plugs.

So far as one is able to judge, there is no advantage whatever to be gained in the case of a four-stroke engine by employing two sparking plugs in each cylinder, but this certainly does not apply in the case of a two-stroke. One of the Scott T.T. machines proved unusually extravagant in fuel, and the fitting of a two-spark magneto entirely cured this, bringing the consumption well up to average and slightly improving the speed of the machine.

I have made careful tests as regards speed and consumption under the following conditions: (1.) With single plug in each cylinder. (2.) With two plugs in each cylinder—one in the side, the other in the cylinder head. The results proved somewhat surprising. The tests were made with sidecar gears and with empty sidecar attached over a tortuous mountain route, so that conditions generally were unfavourable for good consumption. The following results were obtained:

With single spark:

24.7 m.p.h. 44.2 m.p.g.

Double spark:

32.7 m.p.h. 65.2 m.p.g.

In each case twelve miles were covered.

Great care was taken that all four plugs were in perfect order, but with the single spark the engine was distinctly sluggish, and the exhaust lacked that crisp, clean bark reminiscent of T.T. days. Climbing was poor, and the engine missed fire at intervals. If for an instant the two top plugs were connected up, the note of the exhaust was immediately changed, and one could feel the engine picking up on the gradient. It is necessary to explain, however, that the fuel consisted of a

half and half mixture of petrol and Binks fuel, and it is conceivable that the difference would not have been so marked had a lighter fuel been employed.

#### Using a Heavy Fuel.

Riding solo my machine gives a mileage of seventy-eighty per gallon, this being in a mountainous district. Whether the fuel be pure petrol, half petrol and half Binks, or all Binks, makes no perceptible difference to the m.p.g. On the half and half mixture the engine "revs." faster and develops slightly more power than on all petrol, but if Binks fuel only be used the running is decidedly faulty. I have recently hit upon an arrangement, however, which proves highly satisfactory, and which would appear to have removed all the petty nuisances previously encountered with the heavy fuel.

#### An Auxiliary Petrol Jet.

From the small petrol tank shown in the open portion of the frame there extends an ordinary copper pipe connection, terminating in a filter. From this filter extends a second copper pipe, 1in. in length, which is screwed and sweated into the induction pipe, and which contains a Binks 000 jet. Thus when the tap under the small tank is on the petrol enters the induction pipe via the 000 jet.

Method of fixing small petrol tank on Scott. Note quick-starting jet fixed in induction pipe.

The main tank contains heavy fuel, and the small tank No. 1 spirit. In starting both taps are turned on. A small quantity of petrol then drips into the induction pipe, having the same effect as an injection of petrol, while the carburetter slowly fills with the heavy fuel. (As a rule it is necessary to flood

the carburetter of a Scott fairly liberally in order to effect an easy start, and much fuel can be lost in this way.)

Now the small petrol jet, while acting as a quick starter, also entirely takes the place of the ordinary pilot, the latter being permanently sealed with solder. In starting, the throttle is opened till the "pilot" is uncovered; this gives the correct starting mixture for the petrol jet. Until the engine is properly going carburation is erratic, but immediately the engine begins to warm up it runs perfectly on the petrol jet.

We start on petrol in the ordinary way—without flooding, without the trouble of injecting. None of the heavy fuel passes the carburetter till the throttle is sufficiently opened to uncover the middle jet, so that at low speeds, when carburation is apt to be faulty, petrol gas only is admitted to the cylinder. At about 20 m.p.h. the middle jet comes into use, and the proportion of petrol now used is much lower than the proportion of heavy fuel. At full throttle both the middle jet and the main jet are supplying heavy fuel, while the pilot only is supplying petrol. Thus, while petrol is always being consumed, the proportion falls off as the engine speed increases, and the mixture does not become excessively heavy till the engine has attained a speed at which it is capable of properly carburating a heavy fuel.

The proportions consumed depend, of course, on the speed at which one rides. To economise in petrol, cut down the size of the auxiliary jet and employ a larger middle jet. By doing this it is easily possible to cover 250 miles per week on the predetermined half gallon, and the arrangement is theoretically and practically better than the employment of mixtures, which are apt to fluctuate—each different mixture requiring a different carburetter setting. When the engine is idle the petrol tap is, of course, turned off immediately.

#### A Troublesome Knock.

One thing has troubled me exceedingly with this Scott engine when heavy fuels are used—a curious and illusive knock. This knock is evidently determined by the atmospheric condition. On the rare occasions when a spare afternoon has offered an opportunity of investigating it it has stubbornly refused to occur, whereas it is sure to develop at regular intervals during a day of serious business riding. It never occurs on hills. One can bring the engine to a standstill on full throttle without the faintest suggestion of a knock. It occurs only at a speed of from 27 to 34 m.p.h., and it is

**Economical Management of a 3½ h.p. Scott.**—unlike any other knock on earth, except that it is extremely troublesome, demanding instant readjustment of the carburettor controls.

I came to the conclusion that this state of affairs was due entirely to the high compression of the Scott engine, the charge detonating on compression, for no alteration of the firing point effected an improvement. It was cured by fitting small extension pieces into which two of the plugs screw. These extension pieces slightly reduce the compression, and they also have the desirable effect of protecting the two more important plugs from oil. But their presence slightly interferes with the running at high speeds.

#### Cooling the Plugs.

The plugs in the cylinder heads are dependent on air cooling, and for a long time I suspected these members, with their fine wire points, of causing pre-ignition. I still believe that their presence made it necessary to resort to the use of compression reducers, and with heavy fuels, which are apt to cause overheating, it is well to make every provision possible in the way of cooling the sparking plug. I am of the opinion that most overheating troubles originate at the sparking plug.

Realising this, I carried out an excellent suggestion set forward in these columns by a correspondent, the accompanying sketch being self-explanatory. The

A sparking plug radiator.

main as cool as those penetrating the water jackets.

The top plugs are fitted also with copper discs directly below the cable connections. These were fitted in the hope of conducting the heat away from the central electrodes—the real offenders. Their value I have yet to prove. If the plugs were so designed that the heat would pass readily from the central sparking point to the top of the stem these discs would doubtless prove of value, but the present day sparking plug is far from being a perfect article, and anything in the way of gadgets are hardly calculated to improve it.

#### Fitting a Hot Air Intake.

I have found that two-stroke air-cooled lightweights are, when started, entirely indifferent as to whether the fuel they consume is all petrol, half petrol and half something cheaper, or all something cheaper. I recently filled up a two-stroke Triumph with paraffin. It purred home merrily. My little Velocette, which is a gem of comfort and efficiency, starts immediately on a mixture of two-thirds Binks and one-third petrol. The Scott, on the other hand, having the very desirable feature of water-cooling, demands an efficient hot

air intake if heavy fuels are to be used.

When fitting my carburettor, I made the following provision as regards the

air supply. A lin. copper tube was fixed the entire length of the silencer, and through this tube the air is drawn, via two elbows and 1ft. of flexible piping. The flexible piping is lagged to prevent radiation, and the elbow which screws on to the carburettor is drilled with air holes. In cold weather these air holes are covered by a steel clip; in hot weather, when the atmosphere is warm and consequently expanded, the engine runs better with these air holes uncovered. When flexible tubing is used, it should be at least ¼ in. larger than the air port on the carburettor.

I do not think bad carburation of a heavy fuel would be so likely to damage the cylinders or bearing of a Scott engine as it would to damage those of, say, a 3½ h.p. internal flywheel four-stroke. With the latter the crank case holds a considerable quantity of oil, which may become thinned down by gradual percolation of the fuel past the piston rings. I may add that I have never known this to happen, but I am assured that it *does*. With the Scott, on the other hand, a very small quantity of oil is carried in the sump, and as this is constantly changing it cannot very well become unduly thinned.

During the spring cleaning evolutions an old leather golf bag was unearthed, and the stitches having rotted, it was consigned to that restful place where so many dear old friends go during this

regrettable and, I suppose, necessary period. Realising that the tank of the Scott was its most disreputable feature, I rescued this pathetic pre-war relic in the nick of time, and by the use of a few brass eyelets converted it into a most respectable covering for the tank. The pocket amidship, provided for spare balls, etc., comes in vastly useful for carrying a small "King Dick," oil-can, and other emergency gear.

#### General Hints.

If properly managed, a Scott motor cycle is by no means costly to run, while for speed, comfort, and ingenious design it would be hard to beat.

To obtain good results observe carefully the following words of wisdom. If a single-drip oil feed is used, keep the plunger clipped down and depend upon the suction of the crank case. Should one cylinder get more oil than the other, take out the small stops contained in the unions of the oil feed pipes, and hammer up the stop which is permitting an excessive feed to pass. Carefully repeat this process till correct distribution is obtained.

Low consumption and smooth running are largely dependent on correct oiling and the entire absence of air leaks. All the joints should be carefully made with seccotine or some other suitable preparation, running it well round the pins by which the rods holding down the cylinders are secured, and also round the cylinder joints.

It is a mistake to correct the tension of the chains by running the countershaft out of alignment with the engine. The high gear chain on my machine is so slack that it will almost meet, but it has run thus for over 2,000 miles, and the alignment being perfect I have no fears for it. Broken countershaft chains are invariably due to incorrect alignment—not slackness.

To correct countershaft alignment place a square at the extreme edge of the crank case door, and measure from the edge of the square to the centre of the shaft on either side.

H.M.B.

Checking alignment of countershaft by the use of a set-square and rule.

## THE EDMUND PANNIER TANK.

NOW that paraffin, petrol-paraffin mixtures, and other heavy fuels have to form the chief source of power in these days of restricted petrol supplies, motor cyclists will be interested in the Edmund pannier type petrol tank, which, owing to the design of the frame, is essential. The two compartments are of equal size, and are independent of each other; they can therefore, if necessary, be used to contain petrol and paraffin respectively. The feed pipes can then be connected up by means of a T union, and pure petrol used for starting. After the engine has warmed up, it may be run on either pure paraffin or the taps so adjusted as to give a half and half mixture or a mixture in whatever proportions gives the best results.

## SIMPLE METHOD OF RUNNING ON PARAFFIN.

THOUGH there is nothing novel in the device we are about to describe, it is some satisfaction to motor cyclists to know that they can purchase a complete outfit which may be fitted to their motor cycles to enable them to run on pure paraffin without difficulty. Messrs. Attwood's, 86, Rosebery Avenue, London, E.C., sell this equipment, which consists

The Attwood petrol substitute equipment described in the accompanying letterpress.

of a torpedo tank to fit on the top tube, a four-way branch to be attached to the bottom of the float chamber, and a coil of pipe. The torpedo tank contains petrol for starting purposes.

To start the machine the tap at the bottom of the four-way device (at the bottom of the float chamber) is turned on, and the float chamber is drained of paraffin, which is placed in the main tank. This tap is then shut off, and the petrol tap is turned on. The engine is started up in the ordinary way. The paraffin is turned on and the petrol turned off, when the machine should run on pure paraffin. The pipe conducting paraffin is wound once or twice round the cylinder, so that the heavy fuel is thoroughly warmed; in fact, after a few minutes' running the pipe becomes very warm, and the warmth even extends to the float chamber.

We were driven for some distance in an old British Excelsior machine, fitted with a sidecar, in London traffic, and we were able to see that the running on

The spring frame Edmund tank is divided, enabling paraffin and petrol to be carried.

the heavy fuel was quite satisfactory, the only difference noticeable being when one was stopped by traffic and it was necessary for the engine to pick up. On this occasion there was the usual "paraffin knock," which may be obviated by judiciously slipping the clutch or changing into a lower gear. On a straightaway run, practically no difference could be noticed. The test was made on common, cheap paraffin.

## A DOUGLAS ON HEAVY FUEL.

WE recently met quite by accident an officer not unknown in motoring circles in peace time who has seen service both in Gallipoli and at the Western front, and was enjoying the concluding days of a spell of sick leave. He was riding a 1915 2½ h.p. Douglas, to which he had added certain fittings of his own which enable him to enjoy his handy little mount notwithstanding the restrictions of the Petrol Committee.

When the gallant officer arrived in England the latter body had not long assumed control, and he had not heard much about it, but it did not take him long to decide that a petrol ticket was not worth applying for, as by the time he received it many of his precious days of respite would have elapsed. So he set to work and rapidly improved his mount, so that it would burn practically anything in the way of fuel.

He first fitted a small auxiliary tank under the main petrol reservoir, to enable pure petrol to be carried for starting purposes, and, finding that as it was situated very little higher than the carburettor the flow of petrol would be greatly assisted by pressure feed, he fixed up a tyre valve and a pump connection. He then came to the conclusion that the carburettor was not adequately warmed, so he fitted a half-inch brass pipe from the rear exhaust pipe to the existing Amac hot air jacket. In his opinion, however, this did not suffice, so he extended the air intake, as seen in the photograph, fitted an extra jacket round it, and connected it to the silencer by means of a further brass pipe, and provided an outlet for the exhaust gases. The inlet pipe and the two pipes conveying hot air are heavily lagged with asbestos bound with insulating tape.

Another improvement was the fitting of an adjustable jet, which was done by enlarging the existing Amac jet and passing through it a tapered wire to the bottom of which a small lever or handle is attached. This needle or wire passes through a stuffing box containing asbestos so as to prevent leakage. Our friend can now start on petrol with a fairly large jet opening, then turn on the paraffin or heavy fuel, and after a few minutes' running close down the jet and obtain a consumption of well over one hundred miles to the gallon. There is a detachable gauze in the air inlet extension which will collect any free fuel and also serve to exclude dust. It should be noted that the rear exhaust valve cap is provided with a brass radiator.

Douglas adapted for running on petrol substitutes. Note position of petrol tank below main tank. The sparking plugs shown are similar to those used in Zeppelin engines.

# QUESTIONS & REPLIES

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street London, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

## Carburettor Blow-back.

**?** (1.) My machine has lately developed a serious blow-back through the air intake of the carburettor, a 1912 B. and B., thus wasting petrol to such an extent that I was left without any on the road. After putting in some paraffin, drops were blown out of the aperture. I do not think that this is caused by the inlet valve not seating properly, as the machine has never done this before. (2.) Are disc wheels dangerous on a solo mount on account of side winds or other causes? I have heard that the steering is seriously affected. Is this so?—D.A.N.

(1.) A weak inlet valve spring would cause the trouble of which you complain. When running on heavy fuel a blow-back is frequently noticed, although it is not noticed with petrol, as when petrol is used the spray is vaporised and not seen when blown back. (2.) We really do not think so, and unless the wind were high you would not feel the ill effects of the disc wheels when cornering.

## Accidents and Insurance.

**?** I have an Allon, insured with the — Co., Ltd., at a premium of £2 7s. 6d. I have had the misfortune to run into a very bad pot-hole, thereby fracturing the frame of the machine. I immediately informed the company of the mishap, and forwarded repairer's estimate. They tell me that no policy of motor cycle insurance covers such accident, but they are perfectly willing, without prejudice, to offer me half the cost of repairs, which would mean £2 12s. 6d. for them to pay. The claim I made is, in my opinion, perfectly in order, there being no evidence of reckless driving, and at the time of the accident I was fully complying with the terms of the said policy. I should esteem it a great favour if you would kindly advise me whether to accept half damages or to stand out for the whole.—A.D.W.

It is not customary for insurance companies to admit liability in the case of damage caused by road vibration. The accident must be due to impact, and although the policy submitted refers to "accidental external means" whilst the machine is being ridden, this is followed by a proviso that the company shall not be liable for the fracture of parts unless caused by impact. We think, under the circumstances, that the offer to pay half the cost of repairs is a very fair one.

## Running on Paraffin.

**?** I wonder if you would be kind enough to give me details of alterations or additions I should require to make in order to allow my cycle to run satisfactorily on paraffin. I refer particularly to alterations to the carburettor. My machine is a 1912 Triumph with their 1912 type carburettor.—H.G.M.

We refer you to recent articles and illustrations in these columns bearing upon the subject. First of all, to enable a start to be made from cold, it is necessary to have a small auxiliary tank fitted to contain petrol; the pipe from this should be connected by means of a T piece to the main fuel feed pipe. Thus, when a start from cold is desired the paraffin tap is turned off and the pure petrol turned on. It may be found convenient to have a drain tap fitted to the lowest part of the float chamber to drain off any paraffin

## Too Small a Jet.

**?** I have a B. and B. carburettor fitted on my 3½ h.p. single-cylinder motor cycle, which has never caused any trouble until a few days ago. I discovered a leakage of petrol; on investigating I found it came out of the carburettor as soon as I turned it on at the tank, and was caused by one of the washers on the jet being defective. However, I obtained a new jet (same as the old one, No. 32), and since fixing same I find my machine will scarcely take any air, runs badly, and gets hot very quickly. There is also a considerable spraying back of petrol through the air inlet directly it is opened. Do you think the new jet has anything to do with it?—C.J.

It would seem that as your trouble coincides with the fitting of the new jet it is probable that, although the jet was marked the same as the previous one, the size is really different. Try fitting the washer from the new jet on the old one. It looks as though the new jet were too small, which would undoubtedly cause the symptoms you complain of. Blow back from the air intake is often caused through weak inlet springs.

## IMPORTANT NOTICE.

### GOODS MADE IN GERMANY.

The proprietors of this journal, being fully in accord with the recommendations agreed upon at the Paris Economic Conference, give notice that they will not permit the advertisements of new goods manufactured in enemy countries to appear in this publication, either during or after the war.

ILIFFE & SONS LTD.

which may be left. In warm weather an air-cooled engine, when once warmed up, will frequently run perfectly well without any alteration at all, but to obtain the best results some device for heating the carburettor and induction pipe are really necessary. This may be done by fitting a vaporiser, such as the Silver, which we recently described and illustrated. A simple method is to take a pipe about ¼ in. bore from the exhaust pipe and coil it several times round the induction pipe, and, if possible, round the spray chamber of the carburettor. All air drawn into the carburettor should be drawn from some position adjacent to the hot cylinder or exhaust pipe. This may be done by fitting a pipe from the air intake and leading it to some suitable position. Benefit is also obtained if the paraffin fuel feed pipe is carried for a coil or so round the cylinder, so that the fuel is warmed before entering the carburettor. You need not make any alteration to the jet. A slightly lower compression may also be used.

## Popping in Carburettor.

**?** I have a two-stroke motor cycle which is causing me trouble. It starts up very easily, but after running with full air for about one mile it starts popping back through the carburettor. Then if I close the air and gradually open again the engine starts off all right for a short time, then the same occurs again. I may say that I have taken the engine down, cleaned the cylinder and rings, also the carburettor, but still the trouble continues.—J.T.

Popping in the carburettor is usually due to too weak a mixture, which may be due to any of the following causes: Stopped or partially stopped jet, choked petrol feed pipe, or any of the petrol passages. The trouble might also be caused by air leaks, either between the carburettor and engine or in the crank case. Retarded magneto timing might also cause popping. The spark should occur when the piston is on the top of its stroke with the ignition fully retarded. As your machine runs all right for about a mile, it would seem that the most likely cause of the trouble is due to a partial or occasional stoppage of the petrol supply. Make sure there is no water in the petrol; this is sometimes difficult to trace, owing to its being transparent.

## TYPES OF AVON TYRES—No. 6

## "Druid"

THE Avon "Druid" Cover is well-known amongst motor cyclists as a good product at a low figure. It is speedy, safe, and wonderfully hard-wearing if properly treated and not given work for which it is not designed. For instance, the "Druid" is quite a good cover for the front wheel of a  $3\frac{1}{2}$  solo, but the driving wheel would be better off with a "Stonehenge" or even a "Tricar" if pillion work is in the programme. Adequate tyreing and careful usage always yield handsome profits in mileage.

## Through the Mud

A great point about the Dunlop non-skid motor cycle tread is that none of the studs are joined up to one another. Therefore the mud can escape freely from the channels between them when the weight is brought to bear, thus permitting the studs to reach solid ground, without which a tread is ineffective.

A tread of what you might call a closed pattern, in which the mud is confined within the pattern of the tread, does not allow it to escape, and therefore the tread never reaches solid ground.

This feature of the Dunlop tread is very effective whether it is a case of driving, braking, or of a lateral skid. It might be as well to point out here that miniature designs become clogged on a greasy road, having a far weaker effect even when new than a worn Dunlop.

### An Elusive Knock.

**?** My 2½ h.p. motor cycle, which I bought new sixteen months ago, develops a most pronounced knocking before I have gone a mile, although it gets plenty of oil, and the engine is quite clean and the bearings all in order. I thought that the compression was too high, so I fitted a plate between the crank case and the cylinder, but this had no effect. I have also changed the plugs, with the same result. The machine goes all right before it starts knocking, and has a healthy exhaust. I have done everything I can to stop the knocking, but have failed, so shall be obliged if you can help me to solve the problem.—E.W.S.

As you say all bearings are in good order and the engine clean, it is extremely difficult to suggest what can possibly be wrong with your machine without actually seeing it. The usual causes of knocking are as follow: (1.) Worn bearings (big end or small end). (2.) Worn piston rings, rings loose fit in their grooves, or rings stuck fast in their grooves with carbon deposit (a very common fault with two-strokes). (3.) Too weak a mixture. (4.) Insufficient lubrication, pre-ignition, caused by carbon deposit, or a faulty sparking plug. (5.) A metallic knock may sometimes be traced to a loose pulley or sprocket. We presume you are running the machine on petrol; paraffin often causes persistent knocking

### Removing the Flywheels.

**?** I have a 1910 Triumph, a beautiful machine, which I am overhauling. I have got the engine down, but in seeking to get out the connecting rod to rebush I am confronted by an unexpected difficulty. I have unkeyed the timing pinion on shaft and removed that side half of crank case, but the pulley side half I cannot move. This would not matter if I could get the flywheels apart, but although I have removed the nut on crank pin the pin refuses to drive out. I am a mechanic, having access to all ordinary tools, but nothing I use seems able to negotiate what in other machines is a simple operation. Could you tell me: (1.) If the bearing spool on the pulley side is fastened internally. (2.) The method of taking off that side of the crank case. (3.) Whether the crank pin is a driving fit through the flywheel, or if the flywheel is screwed on to the crank pin? (4.) The usual method of getting at the connecting rod in this engine?—S.M.

(1.) No; this is merely a tight driving fit on engine-shaft. (2.) You require a piece of brass and a heavy hammer; the flywheels can then be driven out of their bearings. It is best to get someone to support the crank case while you hit the end of the crankshaft a few smart blows with the hammer, interposing the piece of brass to prevent damage to the thread. (3.) The crank pin is fitted into the flywheels on a taper. After the nut has been removed, the pin has to be driven out in a similar manner to that described above. (4.) When the flywheels have been taken apart, the connecting rod can simply be lifted off the crank pin. Separating the flywheels

is really no job for the amateur, as re-assembling is a very tricky job, and really requires special tools, or at any rate a lathe, to make a really satisfactory job. Unless the flywheels are really true bad running will result.

### Intermittent Running.

**?** I have a 4½ h.p. single motor cycle and sidecar, and just recently had a new cylinder and piston; but previous to having them put in it did a bit of misfiring, so I fitted a new high-tension wire. Now the trouble is, after I have run it about five miles it begins to misfire, and if I change from top gear to second gear it will sometimes keep running and sometimes stop dead. If I keep in top gear it stops dead after about thirty yards of misfiring. I have tried closing the air and giving more throttle, and have retarded the spark, but it stops just the same, and after it has stopped I give it one kick, and off it goes again for about another mile and sometimes ten miles, but then commences missing again. I have ground the valves in and changed the plugs. A lot of oil comes out of the timing case, which is by the side of the magneto. Do you think the oil gets into the magneto? I have looked at the points and they appear all right.—CHAS. R.

It is difficult to say what is the cause of your trouble from the particulars you give. An intermittent misfire is usually due to ignition. See to the following adjustments: That the little rocker arm of the contact breaker is not sticking, and that the points separate correctly; the gap when broken should be .4 mm. Unless the carbon brush is oily it is not likely to be the leakage of oil that is causing the trouble. The symptoms rather point to a petrol shortage, which may be caused through grit or dirt in some of the carburettor passages. We would recommend you again to see to this point to make sure. If the engine stops suddenly it might be pre-ignition due to overheating, which might be the result of the new piston being too tight.

### AN IMPROVED RUBBER GOGGLE.

The all-rubber goggle is still very popular among motor cyclists. While visiting the Euston Road showrooms of Messrs. Alfred Dunhill, Ltd., recently we noticed a pair of these goggles fitted with red rubber sponge round the eyeholes. These are specially designed for use at the Front when the enemy is using tear shells, but they will be none the less useful to those of us who have to remain at home, and should be most comfortable to wear.

### Knocking.

**?** Will you please let me know what is wrong with my 2½ h.p. engine? It very soon gets hot, and if I then attempt to open out, or climb hills on top, there is a metallic knocking. It has always done this. I have had a new piston and rings from the makers, but it still persists in behaving in this way. I have looked to the magneto timing; it has a fixed ignition, and the points just break as the piston is within about ¼ in. of top of stroke. The valve timing agrees with your directions in "Motor Cycles and How to Manage Them." To stop the noise, I have to reduce gas and speed on the level, and drop to low gear when climbing. I am using a 24 jet.—D.M.

The trouble is probably due to driving on too weak a mixture, or to using a plug the points of which become incandescent and cause pre-ignition. Use a good single-point plug of good make, and try a slightly larger jet. If the knocking persists, try retarding the magneto timing slightly.

### RECOMMENDED ROUTES.

#### LEICESTER TO GRIMSBY.—T.J.T.

Leicester, Melton Mowbray, Leadenham, Lincoln, Langworth, Lissington, Market Rasen, Caistor, Grimsby.

#### DROITWICH TO ABERYSTWYTH.—H.E.

Droitwich, Worcester, Bromyard, Leominster, Pembridge, Kington, New Radnor, Rhayader, Dyffryn, Aberystwyth.

#### WIGAN TO SCARBOROUGH.—J.M.C.

Wigan, Bolton, Accrington, Burnley, Colne, Skipton, Ilkley, Otley, Tadcaster, York, Malton, Scarborough. Approximately 130 miles.

#### SCARBOROUGH TO BEDFORD.—J.M.C.

Scarborough, Great Driffield, Beverley, Hull, New Holland, Brigg, Lincoln, Leadenham, Grantham, Stamford, Stilton, Buckden, Eaton Socon, Bedford. Approximately 160 miles.

#### STROUD TO FINSBURY PARK, N.—F.S.R.

Stroud, Cirencester, Fairford, Lechlade, Faringdon, Oxford, Tetworth, Stokenchurch, High Wycombe, Pinner, Beaconsfield, Gerrard's Cross, Uxbridge, Ruimslip, Harrow, Hendon, Church End, East Finchley, Highgate, Holloway, Finsbury Park.

#### BRIGHTON TO GRANTHAM (AVOIDING LONDON).—H.R.A.

Brighton, Shoreham, Steyning, West Grinstead, Horsham, Dorking, Leatherhead, Cobham, Chertsey, Staines, Windsor, Slough, Beaconsfield, Amersham, Chesham, Tring, Ivinghoe, Dunstable, Houghton Regis, Amphill, Bedford, Higham Ferrers, Thrapston, Oundle, Wansford, Stamford, Grantham.

#### SHEFFIELD TO MANCHESTER AND BLACKPOOL.—T.B.

Sheffield, Tupton Hill, Rivelin Mill Bridge, New England, Ashopton, Snake Inn, Glossop, Denton, Manchester, Swinton, Walkden, Chequerbent, Blackrod, Chorley, Preston, Lytham, Blackpool.

## TIME TO LIGHT LAMPS.

"SUMMER" TIME.

Sept. 14th	...	...	7.48 p.m.
" 16th	...	...	7.43 "
" 18th	...	...	7.38 "
" 20th	...	...	7.34 "

## The Late Mr. Arthur R. Price.

Trade men have received with deep regret the news of the unexpected death last week of Mr. Arthur R. Price, a well-known Birmingham accessory dealer in Vevo goods.

## A Big Wounded Soldiers' Outing.

It is anticipated that all outings for wounded soldiers will be eclipsed on Saturday next, the date of the run arranged by the staff and workmen of the Triumph Cycle Co., Ltd. A large fleet of sidecars and cars will pick up men from hospitals in Coventry and district, and convey them to Stoneleigh Park, where a varied and enjoyable programme will be gone through.

## Great Increase in Petrol Imports.

Great interest has been aroused by the fact that 28,773,053 gallons of petrol came into this country last month, whereas only 11,526,600 gallons were imported in the previous month. These are stupendous figures, and one realises what they mean better when we say that the August figures prove that on the average 38,621 gallons of petrol came into the country every hour.

## Girls' Plucky Enterprise.

In our issue of July 27th we mentioned that two American lady motor cyclists, Miss Adeline and Miss Augusta Van Buren, were attempting a journey across the American continent mounted on Powerplus Indians. During their great journey they made a detour after reaching Denver in order to make the ascent of a famous American mountain test hill, known as Pikes Peak. The length of this hill is twelve miles, and it rises about 14,000 feet, with an average gradient of 1 in 14 and a maximum gradient of 1 in 9. The surface is extremely rough, and appalling corners abound. The two girls report that they had little difficulty either in ascending or descending. After the climb they returned to Denver and continued the following day on their way to the Pacific Coast. Their route lies *via* Salt Lake City, and around the great desert, which will undoubtedly prove the most arduous part of their long journey. From San Francisco the sisters will return to New York.

## Vaporisation of Heavy Fuel.

Yesterday's issue of *The Light Car* contains an article on the use of a vaporiser in connection with heavy fuels. The advantages and disadvantages of heavy fuels, from a light car owner's point of view, are summarised as follow:

**ADVANTAGES.**  
1. A saving of 6d. to 1s. 6d. per gallon.  
2. No restrictions as to storage.  
3. Fairly easy to obtain.

**DISADVANTAGES.**  
1. Lack of elasticity in the engine.  
2. Necessity of changing down earlier on hills.  
3. Slightly less power.  
4. Petrol essential for initial starts.

## Revival of Old Inventions.

Among recent patents filed is one relating to spring forks. This patent was applied for by a Mr. Frank Spencer, and consists of utilising rubber buffers in place of steel springs. The specification shows it fitted to a Triumph type fork. Readers will no doubt remember that on practically all Triumph racing machines the main fork spring was replaced with a rubber pad to prevent excessive bouncing. Another revival of an old practice is seen in the patent applied for by a Swedish motor dealer, Mr. Emil Alfred Jern, of Gävle. This patent is really a revival of the old front-driven Werner, the engine being mounted on the steering head, and driving by belt to the front wheel. The only improvement on the old Werner system is the inclusion of a magneto and spring forks. It is remarkable how these old inventions keep cropping up under new names.

## SPECIAL FEATURES.

## TRIALS REMINISCENCES.

ECONOMICAL MANAGEMENT OF A SCOTT.  
MILITARY NOTES FROM FAR AND NEAR

## Death of a Well-known Manufacturer.

Mr. William Allday, of Birmingham, died last week at the age of 66. He was managing director of Alldays and Onions, Ltd., a firm of old standing, and manufacturing, besides the well-known Allon motor cycles, motor cars and commercial vehicles.

## A Commendable Decision.

In the endeavour to avoid street accidents, the London General Omnibus Co. has arranged for a special staff of instructors to visit the various schools in the London area with a cinematograph apparatus, for the purpose of pointing out to the children the dangers that exist, and to illustrate means whereby they can be reduced to a minimum.

## "Stop Petrol Substitutes" the Latest Cry.

A daily newspaper says that it is time the Government did something to stop the use of petrol substitutes. We expected a growl of this nature sooner or later. If the unexpected happened, and the use of substitutes was restricted, it might mean that the newspaper in question would have to curtail its motor delivery fleet. Then everybody would laugh.

## THE TALLEST MOTOR CYCLE AGENT IN THE WORLD?

Mr. Früs Hansen, of Copenhagen, is 6ft. 10in. in height. He represents the Harley-Davidson Company in Denmark, and he has just sold a Harley-Davidson to Prince Axel of Denmark. This photograph was taken in London, and shows, reading from left to right: Mr. Duncan Watson (managing director of the English company), Mr. J. A. Stone (director), Mr. Früs Hansen, and Mr. Walter Davidson (president of the parent concern)

### The One-stroke Engine.

Has any reader ever heard of a one-stroke engine? Such an engine has been designed by a reader, who has recently applied for a patent to cover his invention.

### Royalty who Motor Cycle

The King of Spain has always been a lover of outdoor sport, and a very enthusiastic motorist from the early days. Hence it is not surprising to hear that he has purchased a sidecar outfit for his children, his choice being an Indian. On the previous page we chronicle the purchase of a motor cycle by Prince Axel of Denmark.

### "Joy" Chars-a-bancs and Petrol.

At Conway, on Monday last, two companies running chars-a-bancs in North Wales were summoned for permitting motor spirit to be used for propelling motor chars-a-bancs on pleasure trips. In one case the defence was that the fuel used was a petrol substitute not inflammable at 73° F., and therefore not a motor spirit. The police retort to this was that the fuel was capable of being used as motive power for cars, and that was within the definition adopted in the Order. In the second case the defence was that the car was not a char-a-banc or a like vehicle, being an ordinary hired four-seater. In both cases fines were inflicted.

At Bournemouth a different view was taken. The solicitor for the defence, in asking for an adjournment, said he was confident that he could prove the char-a-banc was not being run on motor spirit. The magistrates, in granting the adjournment, said they could make no restriction on the running of the cars in the meantime.

### Are "Joy" Chars-a-bancs Prohibited?

Here is another case of muddling! The Conway Police Authorities rule that chars-a-bancs are prohibited the use of the roads, no matter what spirit may be used. On the other hand, the Bournemouth police adjourned a case against a char-a-banc proprietor on the latter's undertaking to prove that he was not using petrol—but a substitute.

### Admiral Arbuthnot Trophy Fund Over £200.

Since the figures published in last week's issue have appeared the following subscriptions to the above fund have been received:

	£	s.	d.
Dunlop Rubber Co. ..	5	5	0
Williamson Motor Co. ..	5	5	0
Rex Motor Mfg. Co. ..	5	5	0
Palmer Tyre, Ltd. ..	5	5	0
J. Chater Lea ..	1	1	0
J. Pedley and Sons ..	1	1	0
Lt.-Commander C. Benson, R.N. ..	1	1	0
Captain C. V. Bennett ..	1	0	0

The total sum subscribed now amounts to £206 1s. 6d.

The following donors, it may be mentioned, sent their subscriptions through *The Motor Cycle*: North Wales Motor Exchange, Capt. C. V. Bennett, Fleet-Surgeon H. Trenchard Rossiter, R.N., and County Cycle and Engineering Co.

At the next committee meeting of the A.C.U. it will be proposed that the competition for the trophy be open to officers in both Services (see letter from Capt. C. V. Bennett, page 233 this week).

### No Imports Last Month.

August represented the first blank month in the matter of imports of motor cycles.

### The Principal National Funds.

At the week-end the principal national war funds stood as follows:

Princes of Wales's National Relief Fund (£25,443,250 distributed) ..	£5,950,646	0	0
British Red Cross Fund ..	4,330,690	4	4
Tobacco Fund ..	113,707	0	0
Lord Kitchener National Memorial Fund ..	280,000	0	0

### Rumanian Petrol.

The Central Powers have hitherto relied upon Rumania for petrol since Russia destroyed the oil well plants in Galicia. Now that this important source of supply is cut off from the Prussians there are rumours that a shortage may soon be expected. The British Isles might benefit from Rumanian supplies, were direct and satisfactory means of transport available.

Sgt. W. A. Davenport. Members of the No. 5 Battery ("the Coventry battery"), M.M.G.S., will remember Davenport well, as he went out with them to France in the early days, he, Pountney and Cocker being sergeants. He was invalided home last year, but is quite well again now, and at present is with a batch of A.S.C. motor cycle fitters expecting to go abroad again shortly. Davenport was only married recently.

### A Successful Year's Trading.

The directors of Messrs. Singer and Co., Ltd., Coventry, have declared a dividend of 20%, the profit and loss account showing a surplus of £54,099 6s. 9d. In acknowledging the services of the staff at the annual general meeting, the chairman, Mr. A. E. Jagger, was pleased to mention that Mr. W. E. Bullock (works manager), who has been ill for some time, was now recovering.

### The War Prisoners' Fund.

Mention has been made before in these pages of the fact that the National Cyclists' Union, 27, Chancery Lane, London, W.C., has established a war fund for the purpose of sending parcels to cyclists who are prisoners in Germany. There are several motor cyclists among these to whom packages, containing food to the value of 7s., are being sent every week. In writing to us Mr. S. R. Noble, secretary of the N.C.U., states: "We shall be obliged to stop sending parcels to the motor cyclists unless our income shows a very decided increase within the next week or two."

### The Motor Trades' Debating Society.

Next month sees activities of the above society renewed for the coming session. Trade men anxious to join should write the honorary secretary, Mr. Charles D. Clayton, 52, Shaftesbury Avenue, W.

### An Exceptional Case.

A reader who sent his application and postal order to the Petrol Control Committee on July 26th tells us that he received his licence three days later. Our correspondent considers himself very lucky, and so he is when his case is compared with many who are still without licences. The attention of those in the latter category is called to the announcement from the Petrol Committee on page 222 of this issue.

### Petrol Substitutes and Ponce Courts.

Several readers have stated that their experiences of some petrol substitutes have shown slightly increased speed compared with pure petrol. This must have been the case with a soldier charged at Aldershot the other day with exceeding the speed limit. The defendant stated that he was using a mixture, and that his machine would never have exceeded the speed limit on petrol only!

### Dominions Sidecar Runs for Wounded Soldiers.

The popularity of sidecar outings for wounded soldiers has spread to the Overseas Dominions. Cape Town had such an event soon after the first was held in England, and Australia followed suit some time ago. As a matter of fact, the climatic conditions in most of the Dominions are more favourable for sidecar outings than those generally ruling at home.

### A Victorian Hill-climb.

The Victorian (Melbourne) M.C.C. still run occasional competitions, though naturally the entry lists are very small compared with the pre-war days. The last mail brought particulars of a hill-climb held at Wheeler's Hill—a favourite resort for competition purposes. The results were:

- OVER 600 C.C.
1. R. Finlay (American Excelsior).
  2. H. Pannach (American Excelsior).
- UNDER 600 C.C.
1. J. Spivey (3½ h.p. Precision).
  2. E. Tyler (3½ h.p. Triumph).
- SIDECARS.
1. P. C. Priestley (Ideal-Jap sc.)
  2. H. A. Parsons (Harley-Davidson sc.)

### More Missing Machines.

Instances of missing motor cycles continue to occur in different parts of the country. The following are particulars of two of the last latest cases brought to our notice:

A two-cylinder 8 h.p. Bat-Jap sidecar with dropped handle-bars, Cowey speedometer, obtained by means of a worthless cheque. Information to the Chief Constable, Eastbourne.

A munition worker's 2½ h.p. 1915 Colonial model Douglas disappeared recently from the Borough Road, S.E. T.T. bars, long scratch on left side of tank. Information to Henry Guish, 7, New Street Cottages, Milton Road, Victoria, London, S.W.

# MILITA

## NEWS OF SERVICE MOTOR CY

### FROM MOTOR CYCLE TO AERO ENGINES.

**D.** A. PEARSON, a partner in the firm manufacturing Peco two-stroke motor cycle engines, has recently accepted a commission in the R.F.C. Supervision of aero engine repairs is, we understand, his chief duty.

### FROM B.R.C.S. TO R.F.C.

**M.** R. GLYNN ROWDEN, who before the war was chairman of the Cycle-car Club, and for two years has been with the British Red Cross Society, both in France and at home, has lately been gazetted to a commission in the Royal Flying Corps as Assistant Equipment Officer. Mr. Rowden was formerly a very keen motor cyclist.

### MOTOR CYCLISTS IN THE R.F.C.

**S**EVERAL readers have written to us with reference to the photograph in the last issue showing infantry men being tested on P. and M. motor cycles with a view to transfer to the R.F.C. as motor cyclists.

These enquirers, some of them riders of long experience, have in several cases applied to the R.F.C. for enlistment, but have been informed that no motor cyclists are wanted. This remark may or may not apply to civilians.

### MOTOR CYCLING TO BUSINESS.

**W**E have had an opportunity of reading a letter written by Capt. G. W. Huntbach, M.M.G.S., from France to a friend at the M.M.G.S. training centre. Capt. Huntbach is a keen motor cyclist, and is now in charge of one of the batteries in France. He writes: "For the last three weeks—

Capt. G. W. Huntbach, M.M.G.S., photographed in his Clyno sidecar 2,300 yards from the nearest Boche sap, and in a well-known town that has still a few walls left standing.

nearly four—we have had four guns in the line, and the other two are on air guard. I motor in to business daily, being overlord of the sector, which means the supervision of many lethal weapons. . . . I still continue to imbibe the practical philosophy of 'Ixon,' and devote such spare time as comes my way to a close perusal of our blue-covered friend, *The Motor Cycle*. I sometimes wish I had the somewhat ancient Premier here when I think of that very delightful spurt up the test hill at Brooklands of nearly a year ago. Meanwhile, the Clyno 'bus satisfies my present desire for speed."

### TRICK RIDING AT A TRAINING CENTRE.

**D**ESPATCH riders are very carefully tested before being finally accepted. The other day a would-be D.R. was put through his paces by a motor cyclist officer at a large training centre. Riding normally, he satisfied the latter's requirements, and he was then told to ride past at a fairly smart pace steering with one hand. This was successfully accomplished, when the rider suddenly stood upon the saddle and rode past with arms outstretched. Returning, he blew the horn with his foot. The officer was naturally taken aback. The trick rider then dismounted and stood at attention, when the officer said, "Where on earth did you learn to do that?" "Up to last Saturday, sir," replied the recruit, "I was earning £25 a week at the Music Hall." Col-lapse of officer.

**ARIEL MACHINE GUN**  
The use of the motor machine gun sidecar has spread and adapted for the conveyance of light machine guns.

### DOUGLAS REPAIR SERVICE.

**W**E are informed by Douglas that, owing to re-arrangement of military base repair shops, we are now not in a position to retain the curtailed repair service hitherto maintained.

### A FRENCH RIDER ON ACTIVE SERVICE.

**W**E are pleased to know that among our many readers in France a number of Frenchmen, some of whom occasionally write us about their motor cycle experiences on active service. One man who sent us the pictures of Rhe reproduced a few weeks ago, has had a varied experience since war began. He started in the infantry, and after active service received a commission. He was wounded last March, declared unfit for the infantry, so he transferred to the mechanical transport and was made a corporal-instructor base with British-built lorries. The move was to the front as a sergeant in the heavy motor artillery, where he is present. He has made efforts to obtain a commission in a motor section, but barred by his age, which is twenty-three, and the French War Office will grant commissions in the automobile services to men over twenty-five.

### NEWS FROM "GERMAN EAST."

**A**RTICLES published recently in the pages describing the experience of motor cyclists serving in the German East African campaign have aroused great interest. So far we have only chronicled the doings of men at home, but next week we shall publish an account from a member of the South African Despatch Rider Corps.

# NOTES.

## IN THE VARIOUS WAR ZONES.

### USED OVERSEAS.

every war zone. A batch of Ariels have been specially and a few of them are illustrated above.

### NOTE FROM SOUTHCOMB MAY.

WE have had a note from Col.-Sgt. W. F. Southcomb May, late honorary secretary of the Motor Cycling Club. Southcomb May joined M.M.G.S. eighteen months ago, but, bored with waiting for departure overseas, volunteered for service in a Coast regiment intended for German Africa. His letter was posted at Mombasa, where they had arrived after weeks on board ship.

### MOTOR CYCLIST IN THE SOUDAN.

WE hear that S. W. Carty, before the war a prominent motor cyclist in Newcastle and Liverpool, has received a captaincy. He has only recently returned from the Soudan, where he was in charge of a detachment of lorries and men working the supply transport of the Western Frontier Force fighting against the Sultan of Darfur. It is over 2,000 miles south of Alexandria. Capt. Carty's section went by rail to Assouan (Shallal), then down the Nile on barges to Wadi Halfa, then by rail to Khartoum and El O Beid (Kodofan). From there they trekked the west two hundred miles over desert and bush, where nothing but camels for transport had been seen previously. Supplies of all kinds were carried by motor lorries backwards and forwards to the railway at El O Beid to the east of operations. Darfur lies between French Equatorial Africa and Kordofan. The Sultan's army was beaten and the country taken over. Capt. Carty was praised by the Sirdar (General Sir Gerald Wingate).

### CAPT. W. B. LITTLE.

STAFF Captain W. B. Little, the famous Lake District motor cyclist, has just been gazetted a full captain in the Regular Army. Though at present retaining his work on the staff of his brigade, he will in due course take up his duty with the East Lancashire, to which regiment he has been appointed. This means that

after the war is over Capt. Little will remain in the Regular Army—a regrettable loss to the motor cycling world, but doubtless a national gain.

Thus far, though recently in the very thick of the fighting, he has come through practically scathless, with the exception that he was "gassed" in the early part of 1915. His last letter ends, "One longs for the peaceful heights of Cumberland! How I should have loved to have seen your mountains and dear old Keswick again—it is three years since I was there in summer time. However, I shall have to grin and bear it."

Capt. Little was the first motor cyclist to climb Skiddaw.

### TYRES ON ACTIVE SERVICE.

A MAN in the M.M.G.S., who has been invalided from France and is now in a Hertfordshire Hospital, says that he never had occasion to use a pump to the back tyre (Dunlop) of his Triumph during the six months he was riding the machine.

### M.M.G.S. AND RECRUITING.

FOLLOWING upon the letter from the Army Council to the Editor of *The Motor Cycle* in connection with his work of recruiting, the Commanding Officer of the Motor Machine Gun Service, Lt.-Col. R. J. Colson, has written to Mr. Smith expressing his appreciation of the services rendered, of which the following is an extract:

"I feel that I cannot allow your connection with us as Recruiting Officer to pass without writing to you, and again telling you how very grateful we of the Motor Machine Gun Service are for the services rendered in this respect by you."

"Since the formation of the Motor Machine Gun Service, unquestionably the fact that we have been able to enrol such an intelligent class of recruit is entirely due to the efforts of yourself and other friends of *The Motor Cycle*."

"I write this letter on behalf of the officers of the Motor Machine Gun Service, who have much appreciated the work done by you. To their expression of thanks I wish particularly to add my own."

Maj.-Gen. Sir F. S. Robb, C.B., M.V.O., wrote:

"The excellent work done by Mr. Geoffrey Smith is fully appreciated."

From a thumbnail sketch made by Capt. Huntbach. The following is his inscription: "The hill-climb of the future handicap event—1st, 3½ h.p. 'Splinter-proof,' Cpl. Helmet-Steele (scratch), makes best time of day in spite of severe handicap of four whizz-bangs, one belt S.A.A., and three grenades: 2nd, 'Ixion,' on his A.B.C."

## AVERAGE PRICES.

(From "The Motor Cycle" of Sept. 7th.)

WE give below the average prices of second-hand models offered for sale in *The Motor Cycle*. Where it is possible to obtain a sufficient number of each model the average for the past week is quoted, otherwise the last average is given, if within five weeks.

Make.	Year.	H.P.	Average - for last week.	Latest average obtainable.
A.J.S.	1914	6 3-sp. sidecar	£55	—
"	1916	2½ 3-speed	—	£52
"	1915	—	£90	—

## McLAUGHLIN VARIABLE SPEED GEAR.

Incorporated in the Engine.

A VARIABLE gear obtained by means of several bevels and sliding pinions or dog clutches is not altogether new to motor cycles, and has been quite common in connection with cars, several having been arranged to give even four or five speeds, but a simple adaption of this type of gearing has been provisionally patented by a Mr. A. W. McLaughlin.

The gear can be adapted to be placed in almost any convenient position—either in the back wheel or in the engine. In this particular patent specification the gear is incorporated in the engine, and so does away with a separate gear box unit. It is proposed to utilise the flywheels on which to secure the large bevel or gear wheels, or the teeth may be incorporated with the flywheels.

With each set of teeth or bevel gear on the engine engages a small bevel or gear wheel, mounted on a shaft, which is coupled with the final drive. This may be either by shaft or any other convenient means.

These gears are mounted in such a manner that they can rotate freely on the shaft, but cannot slide. Therefore, when not connected solidly up by a sliding double-faced dog clutch to the transmission-shaft, they are able to rotate freely, and to give a free engine or neutral position. The driving-shaft between these two loose pinions is either squared or feathered, on which the double-faced dog is mounted, and on which it can slide but not rotate independently. Consequently, upon movement in either direction, it is possible to lock either pinion solid with the shaft, and so obtain a variation of gear ratios.

The chief point of interest is that, by adopting this type of gear, all ratios are what might be termed direct-drive—that is, the drive being transmitted direct from the power-shaft to the transmission-shaft through only one set of gears, no matter which ratio is engaged. The specification only indicates two speeds being utilised, but there is no reason why more should not be used.

## SOME USEFUL PATTERN TAIL LAMPS.

THE three tail lamps illustrated are neat aluminium castings sold by the T.W.R. Manufacturing Company, 5, Baldwin Gardens, Acton, London, W. Having smooth exteriors, being made of polished aluminium, and being practically all in one piece, the lamps are easy to clean, strong, durable, and light. They are, moreover, quite easily fitted.

The three patterns dealt with are so designed that they may be attached to

## EXAMPLES OF T.W.R. TAIL LAMPS.

From left to right: Torpedo-pattern aluminium model for fitting to carrier stay. For bolting to number-plate. With adjustable rear mudguard fixing.

the number plate, to the back mudguard, or to one of the carrier tubes. The T.W.R. Manufacturing Co. also supply other lamp accessories.

## LIVE AXLE FOR SIDECARS

WITH the object of overcoming the trouble sometimes experienced with heavy sidecar outfits due to rear wheel slip, a Mr. A. E. Ralph, of 18, Percy Street, Garndiffaith, Pontypool, has patented a device which can be fitted to any sidecar machine without alteration to the frame, enabling the sidecar wheel to be driven.

On the hub shell of a hub clutch is mounted a spur gear wheel which drives two gears mounted on a short counter-shaft supported in a casting mounted on the live sidecar axle. This counter-shaft transmits the power to the sidecar

wheel via another gear wheel mounted on the end of the live sidecar axle. Now that both wheels are being driven, a differential action is necessary in order to negotiate corners without causing wheel skidding. This is obtained in a rather novel manner by means of a connection between the steering head of the motor cycle and the hub clutch. When the steering head is turned to negotiate a corner the

clutch is slightly released by means of a rod connection between the steering and

A. E. Ralph's design for driving the sidecar wheel.

clutch mechanism; thus when a corner is being taken the drive is transmitted to the sidecar wheel only.

### The Arbuthnot Trophy.

Sir,—Will you please place the enclosed note for £1 to the Arbuthnot Trophy Fund? Could not this competition be open to officers of both services?

C. V. BENNETT, CAPT., A.S.C.

[The amount named was forwarded to the secretary of the Auto Cycle Union, who in acknowledging our letter mentioned that Capt. Bennett's suggestion would be brought up at the next committee meeting.—Ed.]

### Petrol Substitutes.

Sir,—Is it not time that the inflated prices of *all* petrol substitutes were reduced? What I say is get a vaporiser, which can be had for a few shillings, and run on the cheapest, commonest paraffin. Do not mix it with petrol. After this war petrol will not be heard of. A. DURANT.

Sir,—I was disappointed much the same as "CW 45." I called at the Binks works, and was charged 2s. 8d. per gallon for five gallons. I asked if it would be necessary to change the jets in my carburetter (a new 3 jet Binks), and was told no, as I had a hot air pipe fitted. The result was not so good as on paraffin. J. LEEDALE.

Sir,—Commencing to run an Allon two-stroke on paraffin, I found it a deal of trouble to start the machine. Petrol had to be injected and the plug removed for the purpose. This seemed the only way. It was then very difficult, and the process of removing and replacing the plug needed to be repeated several times. But a better method occurred to me. I removed the valve from the top of the drip feed, and, with the pump empty, poured the petrol down the oil pipe into the crank case. The result was, of course, an immediate start, and the method never fails. Best White Rose paraffin is used, at 1s. 4d. per gallon, and is quite satisfactory. (Rev.) T. W. MORGAN.

Sir,—I read with interest Messrs. Binks' letter in your last issue, as this is the first attempt I have seen in print to justify the enormous increase in the price of fuel.

Messrs. Binks make a plain statement that the whole of the increase is to be attributed to the freight. Let us see what this means. A forty-gallon barrel measures approximately twelve cubic feet, so we may take 133 gallons to represent one freight ton of forty cubic feet. This means that an increase from 1s. 4d. to 2s. 6d. per gallon = 155s. 2d. per ton (i.e., 133 x 1s. 2d.). Now do Messrs. Binks maintain that the freight has increased by this amount since they advertised the fuel at 1s. 4d.? R.B.

Sir,—Seeing the letter by "CW 45" in your issue of the 7th inst. my experience may be of interest.

I sent Messrs. C. Binks, Ltd., my cheque for one barrel of fuel at 1s. 10d. per gallon, and was then informed that the price was advanced to 2s. 6d., except to users of their carburetter, to whom it was 2s. 3d. I felt that this was more than I was willing to pay, and so informed them. My remittance was immediately returned, with a regret that I could not purchase at the new price.

What more can "CW 45" wish for in these abnormal times, when the price of everything varies daily?

The usual disclaimer.

CPL., R.E.

## LETTERS to the EDITOR

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address

### Adulterated Petrol.

Sir,—I have been expecting for a long time to see complaints in your paper of the quality of the stuff now sold as petrol, and I hope many readers will take advantage of your columns to let you know their opinions.

Every motorist or motor cyclist one meets in this neighbourhood (Monmouth) is firmly convinced that petrol is now adulterated to a very great extent—in fact, the common opinion expressed is that it is half paraffin. I know that the cylinder and valves of my motor cycle—a 3 h.p. Enfield—get carbonised up twice as quickly as they used to, and that if I happen to spill a little of the so-called petrol on my clothes it smells for hours—an unmistakable smell of paraffin. Petrol would evaporate very quickly, so I consider the experience a convincing proof of adulteration

DAN H. PRICE.

### Running on Paraffin.

Sir,—I should like to give my experiences to encourage riders of two-stroke machines. In the course of the last four months I have ridden two machines, both of which were fitted with the Villiers two-stroke engine, over a distance of more than 1,000 miles on paraffin with perfect success, including a tour round North Wales, embracing the famous Cross Foxes Hill out of Dolgelly, which the Diamond took with my brother on the carrier without a hitch.

I am sending you a sketch showing how the bicycle is rigged up for this work. The paraffin is contained in the

main tank and led to the float chamber by means of a copper pipe, which is lapped five times round the exhaust pipe about 1½ in. from the flange holding the pipe to the cylinders. This assures perfect vaporisation when running, as the paraffin is heated after a short run to such a degree that, should the nut be unscrewed from the base of the float chamber and a

few drops of the fluid allowed to run on to the hand, a nasty burn will be caused.

Petrol for starting is taken from a small tank, on the back stay of the machine, direct to a nipple and jet soldered into the anti-blow back cap of the carburetter. This entirely obviates the necessity of emptying the float chamber of paraffin before a start can be obtained, as the fine spray of petrol enters the cylinder direct, so making, practically speaking, two carburetters—one for petrol and one for paraffin.

The engine will now start up from cold, with the float chamber full of paraffin and the petrol spray running, with one pull of the back wheel. I should like to point out that I have at no time had an air lock in the long paraffin pipe or carbon deposit on the plug points. The consumption of petrol by this method is hardly appreciable, as the amount I have obtained this last month, namely, one and a half quarts, will last indefinitely.

A ride of 216 miles (Wolverhampton to Towyn, North Wales, and back) cost in fuel 2s. 6d., i.e., two and a half gallons of common paraffin.

F. A. HOLWARD.

### When Filling your Petrol Tank.

Sir,—I have noticed that a large number of people, when filling their petrol tanks from Shell or Pratt's cans, invariably hold the cans the wrong way, and thus cause the petrol to splash badly in the funnel. The result is a considerable loss. The enclosed sketch shows the right way to prevent this loss, which at the present time may be of value to several readers.

H.L.S.

### Cause of Overheating.

Sir,—I was interested to read in your issue of August 31st Mr. Stephenson's suggestions as to the cause of overheating. His theory, however, is based on certain assumptions which, I think, are open to dispute. The phenomenon to which your contributor refers is well known to those who are familiar with spark gaps and sparking voltages. So far so good; but can such a phenomenon be reproduced in the cylinder of a motor cycle engine? Personally, I think not; the analogy is not strictly correct. The conditions of your contributor's experiments and those obtaining in an engine can scarcely be assumed to be similar. The experiments, I presume, were made in a still atmosphere, and sparking was maintained continuously. In a motor cycle engine these conditions are not repeated. Between each recurring spark the pressure of the medium rises enormously, and then falls to a negative value, taking atmospheric pressure as standard. The gaseous particles in the cylinder would thus appear to be in a state of motion throughout the entire interval. In these circumstances it is difficult to believe that the ionised particles of gas, which are conductors, still surround the plug points at the next sparking moment, and so by conduction prevent the ignition of the charge.

In very rare cases Mr. Stephenson's theory may prove to hold, but I am rather inclined to attribute ignition failure, accompanying overheating, in the majority of cases, to a failure of the plug insulation at the higher temperatures. That such failure occurs in this manner I have proved to myself on many occasions by heating the body of a plug and then testing its insulation resistance.

Much could be added on the general question of overheating, but that does not concern the above remarks on the suggested theory.

Teddington.

A.K.

Sir,—After reading the leader in *The Motor Cycle* for August 31st on "Overheating and Engine Stops," and also Mr. C. H. Stephenson's explanation of overheating, and also realising, as you say, the possible great importance to motorists in general of definitely finding out what causes an engine to stop when overheated, I have decided to give my own ideas as to what actually happens.

I am of the same opinion as your contributor with regard to the amount (weight) drawn into the cylinder being practically the same when the engine is hot as when cold, also with the remark that the stoppage is not caused by defective lubrication; but I do not think his theory, which he calls "silent" discharge, is the cause, or how is it that changing gear will cause an improvement in the firing of the engine? also the engine will get hotter on a low gear and still continue to fire.

Before giving my theory I will give the facts I base it on. I have an old air-cooled tricar, with handle starting direct to the engine-shaft and accumulator ignition, no exhaust lifter, the engine being started by forcing it over the compression. When this tricar is driven up a very steep hill until the engine stops through overheating, if I get out immediately and switch off the ignition, and attempt to pull the engine over compression, I am only able to pull the piston about one-third the way up the compression stroke

B18

when the cylinder is suddenly forced down with such violence that, if I held the handle firmly, it will cause the front wheel nearest to me to lift off the ground. The force is not like the usual backfire, being a strong push. It is absolutely impossible to hold the handle of this machine against the ordinary backfire. If I wait about four seconds and then try again the same thing occurs only with less force. After waiting another four seconds, if I pull the handle very suddenly I can force the engine over compression, when it will practically start and run three firing strokes, i.e., six revolutions, and then stops. The cylinder casting being very heavy retains considerable heat for a short time.

My theory based on this is that on the compression stroke the gas absorbs the heat from the engine, causing through expansion, gradually increasing compression as the engine gets hotter. This heated, highly compressed gas expanding (lightly exploding) on the compression stroke with gradually increasing force as the engine gets hotter and hotter, until, in some cases, knocking is caused.

In other cases, through badly fitting rings, the force of the gas is practically all wasted before the engine reaches the firing stroke, which finally brings the engine to a stop without knocking.

If this theory is correct it also explains why the engine revives when the gear is changed, because thereby the engine can obtain greater momentum to overcome the expanding gases.

F. B. RUDD.

[We think our correspondent is troubled with pre-ignition, caused by some point in the cylinder becoming incandescent, and the only reason that the symptoms are not accompanied by knocking is that, the engine being of old pattern, the compression is lower than generally used.—Ed.]

### The Scott Sociable.

Sir,—Being a regular reader of your paper, I hope you will publish the following remarks concerning the Scott three-wheeler:

I consider the Scott Sociable is perfect, and I can find no reason to justify Mr. S. L. Burnard's expression that it is "horrible." No, sir, the Scott Sociable is not horrible: it is, only unusual, perhaps, and unusual would mean horrible only for the man in the street, who will not, or cannot, understand, but prefers to laugh. I think Mr. Burnard himself will agree with me when I say the principle and mechanical parts are excellent. My purpose is only to write upon the aesthetic point of view. What would be the basis of your opinion when judging the Scott's appearance? Frequently the artistic value is the result of habit; and many people judge beauty by usefulness. In the early days we found the first motor car very ugly, chiefly because we had been used to seeing a horse before every vehicle.

Thus to some people the Scott three-wheeler seems ugly because they have become so accustomed to seeing four-wheelers. A fourth wheel added to the Scott would be exactly like adding an extra window in a house in order to obtain a symmetrical effect. (DR.) RENE CAMUS.

French Army.

Sir,—Having read Mr. Scott's reply to Mr. Burnard's criticism of the Scott Sociable in your issue of the 17th, we would point out Mr. Scott's remark that "hitherto the man wanting comfort and cleanliness has had no other alternative" than the four-wheeler proves Mr. Scott is not conversant with all that has been done to overcome these defects.

Without going into the technical causes why the sidecar combination and motor cycle are the dirtiest vehicles on the road, we say many years' work by us has enabled the ordinary standard machine to be converted into a perfectly clean vehicle and the comfort increased.

The standard sidecar combination is the most economical vehicle both in first cost and upkeep, and for these reasons will be used by a certain section of the community, and if perfect cleanliness and increased comfort be added, the vehicle is made usable by a great number of professions and trades.

KUMFURT MOTOR CYCLE AND ACCESSORIES CO.  
F. WAUGH.

Sir,—There is no doubt the Scott Sociable embodies the desires of motor cyclists, particularly those who are com-

pelled by their business or profession to ride all the year round in all weathers, and, as Mr. Scott remarks, the absence of the fourth wheel does not offend the eye of the occupants of his Sociable, and is immaterial to their comfort. There are two things, however, I am anxious to see announced, and that is the price at which it is to be sold and its petrol consumption. These two are, in my opinion, of most interest to sidecarists, and will decide whether Mr. Scott is to secure the favour of this market, which, I venture to say, Mr. Morgan has not obtained, because the purchase price of the Morgan runabout is beyond the means of the average sidecarist. I think "Ixon" is right when he says "the Scott sociable at £75 would obtain an enormous vogue, but with every £5 advance towards £100 its chances of big sales would dwindle appreciably, and at £100 might be problematical."

SIDECARIST.

### The Silver Paraffin Vaporiser.

Sir,—Allow me to state that this vaporiser was fitted to my old Progress car in 1899, and was not Mr. Silver's idea at all, nor was it mine or Mr. Durant's. I copied the idea from an old farm tractor used by my firm in Canada, the only difference being that it had an outlet as well as an inlet port for the exhaust gases.

I do not know Mr. Durant, who also claims to have invented the apparatus, neither have I seen any of his vaporisers, although I have seen four similar vaporisers of the Silver type fitted by a Chatham firm.

OLD STAGER.

Sir,—With your permission I will answer Mr. Silver's letter (page 212, September 7th). From what I can see these letters will continue indefinitely until you tell us both to stop. One thing I am pleased to see is that I have a champion in "Adaptable." Evidently others have been to the States besides myself; nearly every oil engine I came across out there had a similar vaporiser so fitted. When I get a minute to spare I intend running round Queen Victoria Street to see how many oil engines in this country are so fitted. I have received an anonymous letter stating that, should Mr. Silver take proceedings against us, the writer will be ready with proofs that the vaporiser was fitted to the first motor cycle introduced into this country. Of course the idea is as old as the hills. Mr. Silver has evaded the point by not giving us the protection numbers. If it is protected we shall contest it, and shall protect all our customers using the device which we have fitted to their machines.

"H.W.J.K." says that there are no such requirements as stamping registered numbers on an article registered. Allow me to state that "H.W.J.K." is wrong, and I would refer him to the official pamphlet on the Registration of Designs.

A. DURANT,  
OAKLEIGH MOTOR CO.

### The Boycott of German Goods.

Sir,—I should like to write you a line in connection with Mr. Pritchard's letter in your issue of August 24th.

Even in business will he welcome German commercial travellers and German goods so soon as the war is over?

"Business"! I am sick of the word. Even now, after this country has really been fighting for its life for over two years, some people seem able to think of nothing but "business." For my own part, I feel it is not a question of "crushing German trade," but—could any Britisher deal amicably with German firms and in German goods directly the war is over without feeling that he is in some way false to the memory of men, from all parts of our Empire, who have fallen in this great struggle? And, worse still, false to those men who will remain with us permanently maimed or blinded—in some cases, maimed or blinded by wilful neglect on the part of our enemies?

No. 2890, R.F.C.

B.E.F.

Sir,—I am sorry if my letter should have vexed your correspondent "M.R.C.S." It was far from my intention to vex anyone, my desire merely being to question the advisability of adopting a trade war after the blood war.

"M.R.C.S." is quite at liberty to contradict my statement that "muddling diplomacy on both sides caused the war," but as he fails to bring any evidence in support thereof, his contradiction is of little value against my statement, which is based on examination of the Government's Blue Book.

Nothing in my letter is so nonsensical as your correspondent's suggestion that in comparing our motors with those of the remaining motor manufacturers of the world, we should ignore German motors. Does "M.R.C.S." want us to believe that German engineering is so rotten that we can afford to ignore it?

"M.R.C.S." does not wish to "help Germany out of her shibboleth of Kultur," but "Britisher" in the letter which started this correspondence said that the "spirit of German Kultur must be crushed," and I agree with him, so that on that point it is two to one against "M.R.C.S."

There is no need for "M.R.C.S." to remind me of the authenticated atrocities, for I have studied the Government book on this matter closely, and notwithstanding that I hope "M.R.C.S." will live to learn that hate can never end hate, and the more you do in the direction of crushing a nation (the thing, of course, cannot be entirely done) the more will you prepare for a future imbroglio, instead of obtaining that which we all desire, i.e., permanent peace.

H. PRITCHARD.

I read a letter by H. Pritchard in your issue of August 24th lamenting that you are supporting the idea of a trade war with Germany.

If Mr. Pritchard will take the trouble to read translations and extracts from German writers written before and during the war he will find good cause to alter his present views. The German writers in question distinctly point out that Germans are the chosen people of God, and that they have the right to mould everyone to their ways of thinking. It should not be forgotten that Germany has waged an economic trade war on us at least for twenty years. Every German is also taught that it would be necessary to wage war to bring other nations to their way of thinking, and it is all nonsense to think, as H. Pritchard does, that after the enemy has been beaten on the field of battle his views will be changed. Our main trouble previous to the war has been the *laissez faire* policy adopted in most of our dealings, and we have greatly suffered for it in the past, and would continue to do so in the future if we adopted the views expressed by H. Pritchard.

Every motorist to whom I have spoken on the subject think your announcement regarding enemy advertisements not only patriotic, but a wise proceeding.

S.  
Wimbledon Park, S.W.

### Variable Ignition for Dixie Magneto.

Sir,—Some time ago I converted a fixed ignition Dixie magneto to variable with excellent results. The enclosed sketch shows the converted magneto at full retard, and 35° of movement are obtainable without misfiring.

All that was necessary was to turn off the die-cast metal plate to the diameter of the projecting lip on to which the dust cap fits, but leaving a small flange at the back. A square gunmetal plate was cast and bored out to fit the new shape of the original end-plate so that they could revolve in relation to one another. An operating bar and a Bowden magneto control finished the job.

The alteration has been in commission on my Connaught for three months now, and has shown no defects. It is a boon and a blessing after fixed ignition.

There is no chance of the ring slipping out of position and altering the gap, as there are three forces to hold it in place. (1.) Contact breaker spring, (2) position of magnets, (3) dust cap. The idea is protected.

K. ORD-MACKENZIE

## PATENTS.

Abridged by ERIC W. WALFORD,

### Rear Springing.

The illustration shows a well-thought-out system of rear springing which can be used with enclosed chain drive, and in which there is a minimum of unsprung weight, whilst at the same time the main rear part of the frame is rigid, so that there is no difficulty in the attachment of a sidecar. The wheel spindle A is carried by a pair of girders B, which are connected at the back and front, and are pivoted at C co-axially with the countershaft. The usual rear frame triangle constituted by the tubes EFG is somewhat modified in form, but, as previously stated, it is rigid, and at the junction of

the tubes E and F are formed the housings for the pivots of a pair of cantilever springs H, the front ends of which are anchored to the frame at J, whilst the rear ends support the wheel-carrying girders B. It will be clear that, as the wheel rises and falls, the girders rock on their pivot C. The right-hand girder carries the chain case K, so that there is no relative movement, and the tension of the chain remains constant. Of course, the system may be employed with belt drive if desired.—Lt.-Commander T. S. V. Phillips, R.N., No. 15,690, 1915.

### A Philipson Pulley Development.

It will be remembered that the well-known Philipson pulley, shown in the sectional view, provides the effect of a variable engine pulley, either automatically by means of a governor weight or

positively by the actuation of a brake device. Briefly, the pulley comprises a fixed flange A, having a sleeve B on which may slide but not rotate the movable flange C. The movable flange is operated by a screw thread device and spring E, contained within a housing F on which the brake G acts. It will be clear that, as the pulley flanges AC are adjusted, the tension of the belt will vary,

B20

and the present patent covers a development whereby, as shown in the plan view, the driven pulley H also is adjustable to maintain the correct belt tension, and at the same time increase the variable speed effect. This is effected by attaching to the boss of the pulley flange C a rod J, the securing pin K of which slides in a slot in the inner sleeve B. Thus as the flange C is adjusted the rod J is moved, operating one end of a pivoted lever L,

the other end of which actuates the corresponding flange of the driven pulley H. Thus, as the engine pulley is opened out to provide a lower gear, the rear pulley is closed, taking up the slack of the belt, and increasing the driving ratio. In order that the amount of movement of the two pulleys may be co-ordinated to give the desired effect, the pivot N of the lever may be adjustable longitudinally, so that the ratio of movement may be varied.—W. T. W. H., and P. C. Philipson, No. 5,814, 1915.

### Two-stroke Engine Improvement.

With the object of preventing misfiring or four-stroking at low speeds, this inventor proposes to conduct a small supply of fresh gas, undiluted with exhaust residue, to the neighbourhood of the sparking plug. The plug A is located in a chamber B, which is separate from the cylinder casting, and communicates with the combustion head by a comparatively small passage C. In the cylinder

wall just below the usual transfer passage is a passage D, which is opened by a port in the piston E just before the main transfer passage is opened. Thus a portion of the charge in the crank case passes through the passage D and pipe F through the non-return valve G into the firing chamber B, driving out any burnt gas therein, and surrounding the plug points. Immediately succeeding this the main transfer and compression take place, and on ignition the pure gas in the chamber B passes through the passage C, igniting the main charge, which, under certain conditions, might not be suitable for firing by a direct magneto spark.—J. T. Booth, No. 14,062, 1915.

## SPARKLETS.

### Joining the Army.

Mr. R. D. Storey, who has been connected with the Great Portland Street motor agency of that name, is giving up his interest in the concern owing to his joining His Majesty's forces. He hopes to return to the business after the war.

### C.A.V. in Manchester.

Messrs. C. A. Vandervell and Co., Ltd., have now completed arrangements at their Manchester depot, 12, Victoria Buildings, St. Mary's Gate, for the carrying out of repairs to accumulators of all descriptions.

### Dreadnought Developments.

Under the management of Mr. H. G. Olden the business of the Dreadnought motor policies has greatly increased in volume, and has necessitated opening additional premises at No. 1, Queen Victoria Street, E.C.

### Petrol Substitutes in London.

We are informed by Oylers, Ltd., 35, New Cavendish Street, W., that they have been appointed sole London agents for Binks fuel and carburettors. They have also taken the agency for Kempol fuel, and intend to specialise in everything relating to petrol substitutes.

### Balancing of Engines.

We are often asked advice on the subject of engine balancing, and it may be mentioned that the present edition of "Motor Cycles and How to Manage Them" contains an extensive article, written in simple language, on the subject. The handbook is obtainable from our publishers, Iliffe and Sons Ltd., 20, Tudor Street, E.C., price 1s. 6d., or by post 1s. 9d.

### Institution of Automobile Engineers.

The first meeting of the session of the Institution of Automobile Engineers will be held on Wednesday, October 11th, at the Royal Society of Arts, John Street, Adelphi, W.C., at 8 p.m., when the president, Mr. L. A. Legros, M.Inst.C.E., will deliver his presidential address. The address will contain, among other things, a valuable collection of data in reference to torque curves of internal combustion engines. It is hoped that this session it will be possible to arrange for the full number of meetings, but, meantime, the institution is engaged on much important work in connection with research and standardisation, the results of which should be available for the members before the end of the session.

### Review.

We are in receipt of a copy of a publication issued by the British Commercial Gas Association, known as "A Thousand and One Uses for Gas." This issue deals especially with the running in of petrol engines on town gas, and the use generally of gas in the motor car and allied industries. The issue is quite interesting, especially in view of our recently published illustration and particulars describing the running in of A.J.S. motor cycle engines on coal gas. This, of course, results in a great saving of petrol.

# C.A.V. Magnetos

BRITISH THROUGHOUT

"The Magneto that is not too proud to spark."—*Motor Cycle.*

**W**ILL positively START UP at a walk; exceptionally lively at picking up; never a sign of misfiring at high or low speeds; miles per hour faster than other magnetos; totally enclosed; dust-proof and waterproof.

Wakefield House, Cheapside,  
London, E.C.

Prompt dispatch can  
now be made.

## Warning!

Experiments prove that, with many petrol substitutes, the oil in the base chamber gets thin and loses much of its lubricating value. The oil is also apt to get past the piston rings.

Only the best lubricating oil should be used to avoid trouble and expense.

The overwhelming list of successes prove Wakefield Castrol superiority.

C.D.C.

Fit

# Wood-Milne Motor Cycle Tyres

and experience real "tyre comfort." They are made on generous lines, and show an increase of 25% Air Capacity. Withal they are the most economical, because, after all, "the best is really the cheapest."

# MISCELLANEOUS ADVERTISEMENTS.

## PRICES.

**ADVERTISEMENTS** in these columns—First 12 words or less 1/6, and 3d. for every two words after. Each paragraph is charged separately. Name and address must be counted. Series discounts and special terms to regular trade advertisers will be quoted on application.

Postal Orders sent in payment for advertisements should be made payable to **ILIFFE & SONS Ltd., and crossed**

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor St., E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

## NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charge. Only the number will appear in the advertisement. All replies should be addressed, "No. 000, c/o 'The Motor Cycle,' 20, Tudor Street, E.C."

## DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged, when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

## SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

## DEFENCE OF THE REALM ACT

Under the provisions of the above Act, advertisers requiring workmen, and whose business consists wholly or mainly of engineering or the productions of munitions of war, or substances required for the production thereof, and whose works are situated within 30 miles of London, must include in every such advertisement the words, "No person resident more than 10 miles away, or already engaged on Government work, will be engaged."

Advertisers whose works are situated more than 30 miles from London can only have their announcements inserted with the approval of the Board of Trade, who will allocate to each advertisement a box number, and collect and distribute to the advertiser all replies received. The necessary forms of application can be obtained from any Labour Exchange or from the offices of this paper, and each advertisement must contain a clear reference to the effect that no person already engaged on Government work need apply.

## S.P.Q.R.

## Small Profits, Quick Returns.

Our machines, new and second-hand, are all offered for sale at the lowest possible prices, leaving a nominal margin of profit.

'WARE the dealers who would make you believe they are in business for reasons of health.

IN COMMON with our competitors, we are in business to make money, and, after ten years of successful trading, we have realised that the easiest way (even if not the quickest) is to give each and every client entire satisfaction.

HOW MANY firms in our business can say they have never charged premiums on either Motor Cycles or Light Cars?

THIS is one of the few ways in which we endeavour to give that satisfaction. WE have never sold a machine except at the maker's catalogue price, and do not take advantage of prevailing conditions to extract the last farthing from our prospective clients.

THINK IT OVER, and, when you are asked to pay £300, or thereabouts, for a £225 car, remember our statement.

MEANWHILE, if you are interested in

## The Use of Petrol Substitutes.

**T**HERE has been excitement in certain quarters during the past week concerning the use of petrol substitutes, which happened in this way. As briefly announced in our last issue, the Conway magistrates decided that it was illegal to run a char-à-banc on a petrol substitute, after taking into consideration the new regulations in which motor spirit was defined 'as an inflammable hydro-carbon, and any liquid containing hydro-carbon which was capable of being used for providing reasonably efficient motive power for a motor char-à-banc. An interfering evening paper then went to see the Petrol Committee on the subject, and one of the officials was alleged to have said that anything used as motor spirit in a motor car was liable to the duty, even water used in a carburettor if it could be consumed.

The very next morning the Petrol Committee denied having ever made such a statement, and ordinary motorists and motor cyclists were relieved to see it stated that there was no restriction whatever on the use of petrol substitutes, and that the Order only applied to chars-à-bancs. This chars-à-bancs Order has, however, been interpreted in various ways throughout the country. In the West, for instance, one morning a policeman was stationed on the high road to tell motorists to go home and put their cars away, as they might not use them for private purposes. The same thing happened in North Wales, where all motor vehicles were stopped. This was, of course, entirely unauthorised, and motor cyclists are still entitled to use petrol substitutes if they can get them. Again at Bourne-mouth the owners of a char-à-banc were fined, not for using paraffin, but because they employed methylated spirit for starting up the engine.

By dint of great persuasion our sister journal, *Motor Traction*, elicited a declaration from the Board of Trade concerning this use of motor spirit and petrol substitutes, and this reads as follows: "While they (the Board of Trade)

have no authority to interpret the regulations, it appears to them that, in considering whether any particular vehicle is one to which the regulation applies, regard may rightly be paid to the question whether it is being used for excursions or trips in the way chars-à-bancs are ordinarily used, *but that taxicabs or cars of the nature of ordinary private cars, even if hired from a garage, would not in any case come within the operation of the regulations.*" Notice of appeal has been given in both the cases referred to above, and the Commercial Motor Users' Association will support the Conway appeal, which will be regarded as a test case.

In conclusion, it may be observed that if the limitations of the supply of petrol are solely in order to ensure an adequate supply for the needs of the Services and munitions work, as we have been led to understand, there can be no objection whatever to the use of substitutes.

## Purchase Oil in Drums.

**O**NE of the leading oil companies has again drawn the attention of the motoring public to the control of tin-plate by the Government. This the average reader may consider a minor matter from his point of view, but as a real matter of fact the question affects him more directly than he supposes. Motor cyclists are in the habit of purchasing small quantities of oil—usually quart, half-gallon, or gallon tins. Almost without exception these tins are not used again, and it is with the object of preventing the unnecessary use of tin-plate that the appeal is made. Now, quite apart from the prevention of waste, it is distinctly more economical to purchase oil in bulk, say in five-gallon drums, than in comparatively expensive small tins. It is not only the user to whom this appeal is addressed; motor agents and dealers throughout the country can and should assist by suggesting to their clients the desirability of purchasing their oil in drums.

### From the Front.

I have just had one of Dr. Lindsay's chatty epistles from the Front. He is evidently aggrieved at being deprived of his Norton, and when he gets his next leave he proposes to call on the designer of the spring fork which he is now compelled to ride, and to take a gun with him. He comments violently on the folly of the War Office buyers, who began by specifying machines with "sit-up" handle-bars and footrests to suit. They tardily discovered that full T.T. bars were the goods for dodging shell holes, but lacked the gumption to alter the footrest position to suit. Dr. Lindsay agrees with Mr. Burnard anent the appearance of the new Scott sociable, and opines that the combination mudguard and petrol tank will soon be eliminated, first by gateposts and finally by the designer.

### About Spring Forks.

I informed my readers some months ago that I intended to try out every rear-sprung frame on the market, and I have nearly completed my wading through the list. I need hardly say that I am more convinced and enthusiastic on the main point than ever I was. I do not wish to ride another rigid rear frame so far as long distance work is concerned, and I imagine that the cruder type of frame will be practically confined to the cheapest and lightest machines when the war allows manufacture to be recommenced on the normal basis. Oddly enough, the subsidiary points have all come to me as surprises. In particular I have realised the noisiness and inefficiency of the average front fork of repute. I have used certain front forks without complaint for years past, and imagined that they were tolerably satisfactory articles. The jars received from them were as nothing in comparison with the much heavier shocks administered by the old rigid rear frame; and any noise created by the front fork was drowned in the clatter of the tool-kit, as it shivered under the concussions received from the rear wheel. But when I take out a rear-sprung model no concussions accrue from behind, and the tool-bag and other back-hamper are dead silent. As a consequence, one's critical faculties are instantly concentrated on the fore half of the bicycle, and one notices the noise and the bumpiness thereof. As soon as rear springs become standardised, and work into universal ownership, we shall get a clamour for better and quieter front forks, so here is an opening for inventors.

### Decarbonisation.

I do not want to reopen this controversy; but rather to underline one or two of its main features. An experienced rider of many makes states his views in a letter to me as follows: "The average small twin requires cleaning every 400 miles, the 3½ h.p. single every 600 miles, and the 6 h.p. twin every 1,000 miles." I should describe these averages as

exaggerated, and applying only to a rider who was as inaccurate in his oiling as he was fastidious about engine tune; but the real point of his letter follows: "A 3½ h.p. water-cooled engine, of which very few riders have experience, evinces no signs of carbonisation in running after 2,000 miles." Parallel testimony comes from a lubrication expert, whose name would be familiar to all my readers if I gave it. He bought a well-known 10 h.p. light car, which has rather a reputation for being under-cooled. As delivered to him, its oil consumption averaged 400-500 m.p.g. He finally undertook some alterations which improved the cooling, and a gallon of oil now regularly lasts him 1,000 miles. The car has run 12,000 miles, and was decarbonised after each 4,000 miles, the quantity of deposit being practically identical on all three occasions. During the first two running periods of 4,000 miles each, the oil consumption was between eight and ten gallons; during the last period of 4,000 miles, the oil consumption was exactly four gallons. Yet the carbon deposited in each of the three periods was identical, and in each case was almost wholly oil deposit. Has any reader a theory which will reconcile these two opposed experiences? The one points towards cooling as a vital element in retarding deposit, the other indicates that cooling has little direct effect.

### Sight Feed Oilers.

More often than not, the description "sight-feed" as applied to drip-glasses, whether on cars or cycles, is more of a practical joke than a terminological exactitude. I don't know whether the real culprit be capillary attraction, or condensation, or vibration, but the fact remains that on most motor vehicles these glasses are usually so thickly smeared with green oil inside that they would not be less transparent if they were made of steel tube. Still, there are happy days when the oil confines itself to a thin central trickle, instead of slinging itself about wholesale, and on these occasions one usually wonders if the designer concerned is a recluse highbrow, who has forgotten the real construction of the human neck, and imagines it is as long as a giraffe's, and has a universal joint every millimetre; for twist and crane as you may, you can seldom see the oil trickle. Hats off—in this respect amongst others—to the 1916 Douglas. Its green trickle is shown against a white opaque background in a banjo-shaped-case, tilted backwards at an angle of about 45°, and mounted as far forwards as possible on the top tube—just under the steering head, in fact. You can see what is going on, whenever the oil and the weather and your own pump management permit the front glass to be transparent. On another machine in my stable, you have to thrust your head down on the near side of the tank, and push it through a convenient gap between the exhaust pipe and the cylinder, if you wish to watch the oil glass!

## SALISBURY PLAIN AND ITS SURROUNDINGS.

A Run Through  
Interesting Country to Visit  
a Friend in Training.

The writer and his A.J.S. sidecar.

**S**ALISBURY Plain being a great centre of military training and the temporary home of many thousands of men, visits to that neighbourhood have been of frequent occurrence by those having relatives stationed there. An impression of a recent trip may be of interest to some who have perhaps rather a remote idea of that vast tract of undulating chalk country which has been aptly likened to the surface of the ocean when heaving after a storm. There is a choice of routes from the West of England, the one most frequently used being through Bath to Melksham on the left bank of the Avon, with its mile long mail coach road from London forming the main street. Melksham is a clean and not over busy town, once a centre of the West of England cloth making industry, but now reviving on account of the extensive manufacture of motor and cycle tyres. Devizes, an ancient and well-known market town, is a few miles beyond, and is an outpost of the Plain. The main street of this place is wide and spacious, and ornamented by a cross erected by Lord Sidmouth in 1814 as a mark of esteem for the borough of which he had been Recorder for thirty years, and which he had represented at Westminster for six successive parliaments.

### An Historic Inn.

It was at "The Bear" Hotel, Devizes, that the father of Sir Thomas Lawrence, the painter, was landlord, and here it was that the youthful artist at the age of seven first learned to draw likenesses and to repeat poetry for the entertainment of customers. A worthy and public-spirited host must Mr. Lawrence have been, for at his own expense in 1770 he set up tall poles every half mile along the road from Devizes to Salisbury. These have now given place to ordinary milestones, but the pioneer of civilisation should not be forgotten. Another interesting feature of Devizes and worthy of passing notice is the Kennet and Avon Canal, which, after taking eleven years to construct at enormous cost, is carried over the hill upon which the town is built in a series of twenty-nine locks. Of the remains of the castle behind the "Bear" not much is to be seen beyond a mound of a keep with surrounding ditch.

Running out of the town by way of the Brittox, a street so-called from the fact that once a Bretesque

or wooden tower stood upon its drawbridge, the right hand road to Andover is taken, and Roundway Hill, which rises immediately from Devizes, is ascended. This hill, or "Runaway hill," so styled by the Royalists, was the scene of the Cromwellian Forces being put to flight in 1643. After the Battle of Lansdown, near Bath, the Royalists retreated to Devizes under Lord Wilmot, who with 1,500 horsemen engaged the Roundhead Army, capturing some 2,000 killed or prisoners. Beyond Roundway Hill, Salisbury Plain proper is entered, still a bleak expanse, although at the present day much has been reclaimed and fields of ripening corn gladden the eye, and clumps of trees are to be seen on almost every hill, planted chiefly as a shelter for game. The great bulk of the land is still occupied as sheep walks, and farm buildings are seldom out of sight. But the Plain still presents much the same aspect in the main as when "Thomas Goldsby" wrote:

"O Salisbury Plain is bleak and bare,  
At least so I've heard many people declare,  
For I fairly confess I never was there;  
Not a shrub, nor a tree,  
Nor a bush can we see:  
No hedges, no ditches, no gates, no stiles,  
Much less a house or a cottage for miles;  
It's a very sad thing to be caught in the rain  
When night's coming on upon Salisbury Plain."

### A Lioness on Salisbury Plain.

There are, however, several comfortable inns on the Plain, the "Bustard," a good and well-kept house, and so-called from the fact that the Great Bustard was formerly common on the Wiltshire Downs, but is now never seen, the last pair of these rare and interesting birds being captured some sixty years ago. The "Pheasant Inn," which we pass further on, is another famous house of call. It was here that the jaded Londoners, Charles and Mary Lamb, often came for rest and quiet, and would walk twenty miles a day enjoying the "quiet delicious lazy holiday." One dark night in October, 1816, so the inn records inform us, a curious and unexpected incident occurred at the "Pheasant." The Exeter Mail, on its road to London, had just pulled up, when the off leader was seized by a lioness. Great was the uproar which immediately sounded over the solitary Plain. Two of the affrighted passengers rushed into the inn and

### Salisbury Plain and its Surroundings.—

locked themselves into an upper room. In the meantime a large mastiff had bounded to the rescue, but paid the penalty of its temerity. The lioness left the horse, which had fought with great spirit, and pursued the dog, which it killed within forty yards. The keeper of the lioness now arrived, and at considerable risk drove it into an outhouse and there secured it. It had escaped from a caravan on its way to Salisbury Fair.

Continuing our road towards Everleigh, numerous tumuli or barrows and remains of early British camps and villages are noticed on the surrounding hills, and authorities state that no tract of country is richer in these early remains than that between Everleigh and Amesbury. In one tumuli recently opened near here were found the remains of a dog and that of its master, buried together with a circular wreath of horns of the red deer and five beautiful arrow heads cut out of flint. Thus we learn that the profession of the Briton here buried was that of a hunter from the mute inanimate memorials to prowess in the chase. We neared Upavon, the object of our ride, a snugly placed village of 500 inhabitants nestling at the foot of several hills. Here our thoughts, which had been carried back probably four thousand years, receive a rude awakening as we approach the Royal Flying

Schools. About a mile of steady rising road from the village brings us to the aerodromes.

Here were ten aeroplanes all-in flight at the same time. With a swing of the propeller to start the engine, the airman, with as much *sangfroid* as one would mount a bicycle, would seat himself, and after a short run be soaring skywards in a moment. Notices at the roadside warning pedestrians and others to "beware of aeroplanes" struck me as peculiar, but as I was still pondering, a huge battle-plane, which had been practising short runs on the grass, rose about six feet in order to avoid me on the road, passing within a foot or so of my head. The shock was so great that I nearly lost my equilibrium, which fact seemed to greatly amuse the airman, who returned and accompanied me along the road overhead for half a mile, whilst I involuntarily ducked to avoid the propeller which seemed to me to be in unpleasant proximity to my head. With a sudden lift my friend left me, and with spirals and bankings was soon a mile above me. The graceful evolutions of the machines were most interesting to watch, with the sun glinting on the white planes and polished aluminium bodies. Practice with machine guns, the gunner perched in a seemingly precarious position, was most thrilling to see.

After a rest and a few calls to look up friends our ride was continued to the great military camps of Windmill Hill and Perham Downs, near Ludgershall. Matters of a personal nature now interested us, and at 6 p.m. the homeward run was commenced, which proved to be a non-stop run of two hours, thanks to the trusty A.J.S. sidecar, which, as usual, ran faultlessly and economically. I discovered I had only used about  $1\frac{1}{2}$  gallons of my monthly allowance during the 110 miles trip. The roads, too, were undoubtedly the best ridden on this season, having recently been entirely remade. "BONA SATIS."

### THE KING OF SPAIN'S INTEREST IN MOTOR CYCLES.

We announced last week that King Alfonso had purchased an Indian sidecar for his children. The lower illustration shows them ready to start for a ride. In the upper picture His Majesty is seen inspecting another Indian, his interest in the sporting sidecar body being very apparent.

# 1,500 MILES WITH A 1916 TRIUMPH.

Road Experience of a Machine identical with those used by Despatch Riders.

**N**O matter what theatre of war a British motor cyclist may visit, there he will find motor cycles rendering yeoman service, scurrying hither and thither with important despatches. And just as certain as one is to find motor cycles, one will see the Coventry-made Triumph, a machine represented in its thousands throughout the different war zones, as a result of continuous productive effort on the part of the manufacturers since the outbreak of war. Chatting with despatch riders, as it is the writer's constant privilege, many will urge that in winter in particular the even pulling twin-cylinder mount—as light as compatible with safety—is ideal; in summer, when ability to keep upright is not so forcibly engrained upon the rider's mind by the state of the roads, reliability is the outstanding desideratum. And it is in reliability particularly where the Triumph excels—why, whereas in the days of hub gears it was no unusual thing for a despatch rider to have a new mount every month or six weeks, we have lately heard D.R.'s expressing in the most affectionate terms how many months (sometimes over a year) their present "bus" has served them.

During the spring and summer it has been our good fortune to possess a 1916 model Triumph, so that we are able to speak of it from personal experience. It has huge flat bars just as supplied to the Army, and the riding position provided by these semi-T.T. bars is very comfortable, but, above all, increases appreciably one's feeling of safety and controllability over the machine. On long runs, however, a touch of back-ache is not unknown to riders who are not out regularly.

## Some of its Mechanical Features.

The 4 h.p. Triumph of 1916 is practically identical with the 1915 design, detail improvements only having been effected. One of these is the adoption of a new type of decompressor, of which more later. For many years the Triumph Co. pinned their faith to the "square engine," a bore and stroke of 84×86 mm. and 85×88 mm. having been retained for a considerable period. But a couple of years ago an entirely new design of long stroke engine was adopted, having a ball bearing crankshaft, roller bearings to the connecting rod big end, and single timing wheel formed in one with its external cams, including the decompressor cam. The capacity of the new engine is 550 c.c.,

The writer's machine.

the bore and stroke being 85×97 mm. respectively. The operation of the valves is effected by horizontal rockers which lap over the cams, enabling a direct lift of the adjustable-headed tappets. In every respect the engine is more sturdy and substantial than its predecessors. The valve heads, for instance, are 1½ in. diameter (they have flat tops), whilst the springs are of generous dimensions, the coils being of large diameter, and so assisting in the dissipation of heat. The cylinder is a clean job, and the ports naturally considerably larger than heretofore, with air passages behind to assist cooling.

The 1916 Triumph is not excessively fast—for that matter, it is geared too low to show up its best paces. The real merit of the latest Triumph is in its ability to maintain a high rate of speed without complaint and without trouble ensuing. High averages on the old 3½ h.p. models were possible, but sooner or later a valve gave out, and, drive you never so cautiously, a hill would be encountered which would suddenly slow the machine and cause excessive knocking. The difference with the "four" is that one may punish it severely, and yet, after the end of a fast non-stop run, accelerate speed on a really severe hill and fly over the top with the greatest ease. The complaint of "drying up" with the 1916 engine is unknown so far as our experience goes.

## The Transmission System.

In addition to the new type engine, 1915 marked another real departure in Triumph practice, and that was the adoption of combined chain and belt transmission and the fitting of a countershaft gear. Thus transmission troubles were swept aside, for with large diameter pulleys belt breakages are entirely unknown (the belt is a rim. section), and the enclosed chain is well able to look after itself. But this system of transmission is remarkably rigid, and at slow speeds there is a certain amount of disagreeable snatch noticeable, due to the short belt centres. Thanks to a first-class clutch conveniently controlled, the kick may be softened until really under way, and the clutch does not seem to mind such severe treatment. Originally, our machine was geared 5 to 1, but, finding that we never had recourse to the two lower ratios, we prevailed upon the Triumph Co. to fit a larger sprocket on

1916 4 h.p. Triumph engine and its component parts.

### 1,500 Miles with a 1916 Triumph.—

the engine-shaft. As a result, the machine has been a good deal more pleasant to handle in open country, but, of course, the snatch at slow speeds has been accentuated. One may be excused for surprise at the fitting of such a low standard gear as 5 to 1 on a 4 h.p. bicycle, but it may be well to explain here that the Triumph experts consider that the positive drive provided by large pulleys, as adopted in the case of chain-cum-belt transmission, does away with all slip, unnoticeable with direct belt drive, but which is nevertheless present. In their judgment, and from our experience we concur, a 5 to 1 ratio with chain-cum-belt transmission is equal to a  $4\frac{1}{2}$  to 1 gear with direct belt drive.

The Triumph carburetter is a magnificent instrument. It enables consistently easy starting—indeed, we have amazed many riders who have been in trouble at different times with engines that start sluggishly by the manner in which our machine has started from dead cold at the second push of the pedal. Never once have we found it necessary to prime the engine. One simply turns on the petrol, gives a single press of the plunger of the float chamber (this operation involving the sealing of the chamber and ensuring petrol reaching the jet without waste), a dig at the kick starter with the air lever wide open and the throttle lever  $\frac{1}{2}$  in. open, and the engine regularly responds.

### On the Road.

At all ordinary speeds the new Triumph holds the road beautifully, and, thanks to the excellent clutch fitted to the Sturmey-Archer gear and its convenient method of operation by lever on the left handle grip, one may pursue a tortuous course in traffic with every feeling of safety. On the open road there is something very nice in being astride a powerful machine. Twenty miles an hour with the throttle but a quarter open, and the engine longing to be let out, as proved by the way it jumps ahead when the throttle lever is opened but a fraction. Devouring hills on top gear is probably the most exhilarating experience, and one can indulge in any amount of this sort of thing without complaint from the engine. We have used the Triumph of which we are speaking a good deal in connection with our recruiting work, finding it more convenient, not to say

faster, on occasion! On a journey to Nottingham, via Leicester and Loughborough, we could not resist the temptation to turn the machine round at the foot of Bunny Hill and try its paces. Not that the hill is steep, but because of our old associations. During the past fourteen years, the writer has pushed, been pushed, run alongside, and pedalled on the various

machines used on this hill. Consequently there is an inward gratification in being able to make fun of Bunny Hill on such a machine as the 4 h.p. Triumph. The gradient was deserted, and suffice to say that the machine showed no perceptible falling off in speed even to the summit. Would that Countisbury and Lynton Hills could be dropped nearer the Midlands! An easy ascent of the Old

Wyche at Malvern on second gear convinced us that the Somersetshire and Devonshire terrors would be easy prey to the new "four."

### Comfort and Road Surface.

Occasionally one yearns for the comfort of a spring frame, for our roads are deteriorating at an alarming rate, due to the abnormal traffic in certain centres and the small amount of road repair work now possible. In consumption our Triumph has gradually improved. Originally it did 65 m.p.g., but latterly, on summer roads, the figure has been nearer 80. We have already recorded our appreciation of the Sturmey-Archer countershaft gear. The various changes of speed are effected with remarkable ease, though we are not surprised that despatch riders have adapted the gear control to be operated by the foot, for in the top gear position the knob-ended lever is apt to chafe on the rider's thigh. If this excellent gear has a fault

it is in the noise emanating from the box on the two lower ratios, both when driving and when the machine is propelling the engine by its own momentum.

Our experience with the Triumph extends to about 1,500 miles, including some fast work. For that matter, what is the use of a steady 4 h.p. mount built for speed, and with dropped

handle-bars too, unless one may be allowed to toy with the throttle lever? One run of sixty-two miles along the Fosseway in pouring rain was accomplished without a dismount. Only once has the engine ceased firing involuntarily, caused by the waterproof terminal jumping off the sparking plug due to striking a pot-hole violently at speed. Incidentally, the experience

The 1916 model 4 h.p. Triumph referred to in the accompanying article.

An enclosed chain conveys the power to the three-speed S.A. countershaft gear.

**1 500 Miles with a 1916 Triumph.—**

gives some idea of the shocks a fast moving machine has to sustain in these days of pot-hole stretches. The Triumph, however, is well able to withstand them. Not a nut has shaken loose on the machine from start to finish. By the way, one day we had rather a shock. Not having had occasion to use the lamp and generator set, and assuming that all was well, seeing that the machine is a duplicate of those supplied to the War Office, we had not observed that the King of the Road lamp was of the swivelling variety, and rendered it liable to confiscation and the rider to be fined. The experience is all the more amazing as the War Office Clynos have exactly the same type of lamp (supplied to War Office specification), and recently the High Wycombe police authorities distinguished themselves by stopping one of these khaki-finished machines, seizing the lamp and fining the driver.

**An Improved Decompressor.**

On later models than that illustrated a small improvement in detail has been made, the method of operating the decompressor being replaced by a novel form of trigger control.

It will be noticed from the accompanying sketch that there are two positions for this trigger, and no midway position is possible. When the lever is set down the exhaust rocker arm is in normal position and engine at full compression. When the lever is pulled up to the horizontal position the rocker is pushed inwards about  $\frac{1}{4}$  in. or  $\frac{3}{8}$  in., and engages with an extra cam set alternate with the exhaust cam. This has the effect

of lifting the exhaust valve for a short period during each compression stroke, thus allowing a portion of the charge to escape, and so reduce the compression.

To start, the rider sets the lever horizontally and

The normal position of the rocker and trigger is shown by dotted lines. The component parts of the fitting are shown below, viz. from the left: Rocker arm actuating spring, sleeve and thrust pin (a small buffer spring is placed inside), dust cover, and operating levers.

either pushes off or kick-starts on half compression; when started and seated, a touch with the foot, and it springs to the lower position, giving full compression. It is neatly made and quite simple in its action.

## THE S.M.C. LIGHTWEIGHT.

**A Novel American Lightweight with Engine Dimensions of 64 mm. x 64 mm. = 206 c.c.**

THE motor cycle trade in America has, as is fairly well known on this side of the Atlantic, concentrated on heavyweight high-powered twins, and in connection with which it has undoubtedly achieved considerable success. Until quite recently lightweights of any kind have not interested either the American trade or public, so it is not altogether surprising to find that what lightweights do exist do not conform altogether to British ideas of perfection. But of late two-stroke lightweights have begun to interest the manufacturers, and we now have several American examples, among them the S.M.C., which is the latest model produced by the Schickel Motor Company, of Stamford, Connecticut. It will be remembered that this firm make a 6 h.p. single-cylinder two-stroke.

An American two-stroke lightweight, the S.M.C.

The S.M.C. lightweight is a new production, and is a curious mixture of American ingenuity and simplicity which amounts almost to crudeness in design. The frame is pleasing in appearance, and follows English lines to some extent. The awkward way in which the exhaust pipe is conducted away behind the saddle tube, and the manner in which the exhaust pipe enters the silencer, practically at right angles, hardly conform to English ideas. It will also be noticed that the machine is single geared, and has solid forks.

The details to hand are not particularly lucid, but from them we learn that the engine is lubricated on the petroil system, and that the chief novelty lies in the magneto.

The magneto is very similar to that employed on Ford cars, that is, incorporated in the flywheel. This dynamo-magneto as fitted to the S.M.C. was illustrated and described in *The Motor Cycle* of June 22nd. The carburetter is of the automatic type, the automatic single-lever carburetter having received far more attention in America than it has in this country.

As regards the engine. The cylinder is cast integrally with the crank case, provision being made for the introduction of the crankshaft, piston, and connecting rod. The cylinder head is separate. It is attached by means of a thread which permits of its ready removal and replacement, while the joint is made permanently gas-tight by means of a copper and asbestos washer.

## A SOUTH AFRICAN DESPATCH RIDER IN "GERMAN EAST."

WE are able to give our readers this week more impressions of the German East African campaign from the motor cyclist's point of view. Our issues of August 24th (page 160) and August 31st (page 180) contained the experiences of English motor cyclists now serving in light armoured motor batteries, whereas the following is from a South African despatch rider operating in the same war zone. The writer (D. Leslie) was at one time very keen upon coming home to enlist in the Motor Machine Gun Section, and wrote the Editor for particulars. However, he was so anxious to do something that he did not wait for particulars to be sent out to him, and so enlisted in the South African Despatch Riders' Section.

Roads, as we understand at home, hardly exist in German East Africa, and even Colonials find the jungle tracks very trying. Hence it is only to be expected that minor troubles were experienced with motor cycles intended for English or ordinary Colonial service. It is a remarkable testimony that the machines with which the South African despatch riders are equipped have stood up so well under conditions exactly the opposite for which they were designed.

The following is Leslie's own account of his experiences:

"The South African Motor Cycle Corps consists of mounted infantry, and the men were recruited from all the different districts of the Union.

"We were sent up to Potchefstroom, in the Transvaal, and here we were put through hard training. When the corps was up to full strength we were all put through another test and the best fifty men picked out as despatch riders, and named the S.A. Despatch Riders. After a month's training these fifty D.R.'s, who must not be confused with the motor cycle infantry, left Potchefstroom en route for Durban, where they embarked on an auxiliary cruiser.

### Tuning Up Motor Cycles at Sea.

"We were told that we would be required immediately we landed at Kilindine (British East Africa), so the officer in charge made arrangements with the commander of the ship to have our machines brought up out of the hold on deck. We spread large tarpaulins on the fore-castle deck and commenced the somewhat unique task of fitting up fifty-seven motor cycles in mid-ocean.

"As soon as we landed we were packed into the train and taken within a few

miles of the firing line—about 200 miles inland. Here we unloaded our machines, filled them with petrol and oil, and sat across the saddles for the first time. Next day we were attached to various units, and were hard at work in one of the least known districts of British East Africa only just over a week from the date of leaving Potchefstroom.

### Mud Half Way up Crank Case.

"The South African country roads are certainly not of the best, even among bad roads, but we never expected anything like the tracks we have had to ride over here—there are no roads at all. We just followed motor lorry tracks across the veldt, and when these did not take one to the right destination we turned off and rode across country, through bushes, long grass, over ant heaps, and through dongas. This portion of the country abounded with game of every description. Large herds of antelopes could be seen grazing on the grassy plains, while every now and again the noise of our exhausts would disturb a troop of zebras or a number of ostriches; also several rhinos and giraffes were seen, and of the rhinos one had to be very careful.

"We did not have much trouble with our machines until the rainy season set in, making the roads one big swamp, and quite impassable even to ox waggon transport let alone motor cycles. I have read a lot about the mud in the French war zone, but I greatly doubt if it could touch the stuff we had. If a motor cyclist could average the same speed as another man on foot over some stretches he was doing well. It is no exaggeration to say that on many occasions I have had my machine ploughing through mud that reached half-way up the crank case, which eventually brought it to a standstill and required the strength of three natives to lift it out again.

### Sleeping in the Rain.

"For the best part of three months we never had a roof over our heads, nor shelter of any kind, but spent night after night sleeping in the open, and often in rain. At first it was not very nice, but we soon got so used to it that it made no difference at all. We must have been in excellent physical condition; no one went down with a cold, though some contracted fever. Now that the rainy season is over, and the roads are dry again, our trouble is not mud but sand. For miles around Kondoa the road lies in a dry river bed, and is at least six inches deep in sand. The best way to get through this is to put in second gear, open the throttle wide, and charge the sand as hard as possible, trusting to the speed to carry one through; but

if the sandy patch is too long or too deep, put in bottom gear, get the wheels in a deep waggon rut, balancing oneself by putting the feet out on either side, and go through slowly—at walking pace. The latter will take one through anything.

"We have travelled about the country for nearly six months without spares or tools other than our tool-kit. The nearest mechanics or workshop are at the base—nearly 200 miles away. Whenever a machine gave in with some part broken we had to pull a good machine to pieces for spares, or keep the damaged one until another creak came along, when we would make one good cycle out of the wrecks. When we started out, all we were supplied with was a repair outfit, spare tube, gaiter, and plug, not even a punch or belt fastener!

### Some Troubles Experienced.

"We are all mounted on  $4\frac{1}{2}$  h.p. B.S.A.'s, and a stronger machine and more powerful engine would be hard to find, but one thing they need for this kind of work is a hand-controlled clutch. Of course, they have their weak spots for work in this part of the world, but with the conditions described the same would apply to any machine.

"The clearance is far too low for cross-country riding. Front spring, front spindle, and saddle-pillar were no doubt designed for home use, and require to be stronger out here. The kick-starter should be enclosed, as sand and dirt get in and clog the ratchet; the spring also breaks very easily. We have all had trouble with the American magnetos, especially during the rainy season, when they were constantly going wrong owing to water and mud getting into them.

"Both rims and spokes could be greatly strengthened. Another item that could receive a good deal of attention is the mudguarding. There is not nearly enough clearance for the tyre. We all had to remove the side pieces of both front and back guards, and, in some cases, the whole mudguard. I may add that the Dunlop tyres are splendid. After five months' running they are still in excellent condition, and good for a thousand miles more. We have had very few punctures."

### ENFIELD OUTFITS FOR NEW ZEALAND POST OFFICE.

Messrs. J. B. Clarkson, the Wellington (N.Z.) agents for Royal Enfield motor cycles, have recently supplied twelve 6 h.p. Enfield sidecar outfits to the Post and Telegraph Department of New Zealand. This is the third order for this make of machine from this department, which speaks well for the behaviour of the machines previously supplied.

# THE MOTOR CYCLE IN CEYLON'S SUNNY ISLE.

Experiences of a Missionary who uses a Motor Cycle in his Work.

**M**OTOR cycling in Ceylon, as a general rule, is no "tea party." In most cases the surface of the main roads is good, but practically all the roads are very narrow—fit for traffic in only one direction. Therefore, on meeting any vehicle which cannot be seen some distance ahead there is always a risk of a collision, for want of elbow room on the road. Then, again, in many parts of the island the roads are very mountainous, abounding in appalling hairpin corners, with a potential disaster at every blind curve. And on such occasions a smash is apt to be serious, as there is probably a fall of anything from a score to a thousand feet to be contemplated should one go over the edge.

## Ceylon Livestock.

But far worse than hills, hairpins, narrowness of roads, and occasional bad surfaces, is the number of livestock everywhere. The ride from Kandy to Colombo is like going through a seventy-mile farmyard, and is typical of thousands of miles of riding throughout the colony. First and foremost there is the eternal and ubiquitous bullock cart, with its two bulls and a "buffalo" of a driver. If the cart were driven along the left-hand edge of the road it would not be so intolerable, but, by some inscrutable design of the Evil One, a cart is always on the wrong side of the road. Often enough the driver will stop by the wayside to have a glass of tea, or a rice cake, or a gossip while his cart goes ahead. Sometimes he goes to sleep in the cart, and trusts that the bells on the bulls' necks will clear the traffic on the road.

I think most of us here would agree that the Ceylon carter is "the limit." If it is possible to have *two* limits probably the pariah dog would be given the questionable honour of equalling the nuisance of the cart. Then there are the fowls, which live on the roads, for the sake of the pickings consequent on the traffic. Besides this, there are innumerable cattle strolling about to find pasture along the sides of the roads. Then there are the pigs,

the elephants, the rickshaws, the racing hackeries, babies playing by themselves on the road, stupid men, and still more stupid women—all obsessed with the one conviction that they are the sole possessors of the King's highway, and that no motors need be expected for at least another year.

I fancy comparatively few people in Ceylon motor for pleasure, but, as there are so few railways, a great number have cars or motor cycles as a practical necessity. For myself, I rarely visit a railway station, except to correct my watch! The other day I saw my wife off at Kandy and met her again at the station in Colombo. It would be a disgrace to be beaten by a Ceylon train, even on a seventy-mile journey.

Last year I did over 7,000 miles, in all weathers, over all kinds of roads. I kept several hundreds of engagements, and never missed one. The 7,000 miles cost me just under Rs. 400, or less than 1d. a mile, including a good bit of sidecar work. This includes every item of expenditure except depreciation. Without the motor cycle I could not have fulfilled half my engagements. My predecessors had two horses, and could not cover the ground nearly as well. Not only do I get through much more work, and thoroughly enjoy the exhilaration of the rapid travelling (when there is not too much livestock in the road), but I save my employers £30 a year on travelling allowance—a considerable saving.

## Big Climbing.

My district runs up from 1,500 feet to about 6,500 feet. I think nothing of climbing 5,000 feet to keep an engagement, and coming back again for dinner. Once last year I rode up to Nuwara Eliya and back (involving a climb of 5,000 feet in the fifty-mile outward journey), kept an engagement, and returned for a late breakfast—12.45 p.m. Had I gone by train I could not possibly have got back before the next day, and should have spent at least £1 more than it actually cost me, including wear and tear of machine, etc., at 1d. a mile.

## SCENES IN CEYLON.

(Top) Ancient rock fortress and royal city, Sigiriya. 1,500 years ago this was the rocky stronghold of the regicide king of Ceylon.

(Centre) The author's Brough sidecar in the heart of the jungle.

(Bottom) Ancient stairway at Sigiriya.

### The Motor Cycle in Ceylon's Sunny Isle.—

After riding a motor bicycle since 1912, I am perfectly satisfied that it is the only vehicle for a busy man, between the ages of seventeen and seventy, who has out-station work. A car is too slow—I do not mean that one should "blind," but on these narrow roads the two-wheeler can slip past the carts, while a car is held up indefinitely, waiting for a chance to get through. Not only so, but on these long hills there is no question about which is the better vehicle for solo work. One of the rides in my district includes a rise of about 3,000 feet in ten miles, along a narrow road, abounding in the sharpest hairpins, with dangerous precipices over the side. This is the Rambada Pass up to Nuwara Eliya—a fine sporting ride that would delight the hearts of the D.R.'s and thousands of others in England and at the Front.

### Practical Experiences of Different Makes.

Now a word about the motor cycles out here. The 7 h.p. Indian is a great favourite with the planters up country for both solo and sidecar work. It is powerful, accelerates well on the hills, and is not too expensive. Indeed, it seems to fill the bill for very many men. Personally, I have never ridden one. But from my own experience, and that of friends, a word may be said as to the suitability of other machines. For solo work the 2¾ h.p. Douglas is well-nigh perfect, except in very hilly country. It starts easily (and that is a great consideration in a climate where one perspires even at the thought of physical exertion), but its two speeds are insufficient for the long grinds and necessity for quick acceleration after the dead slow negotiation of a hairpin. Also, in a drenching monsoon rain, I have found that the belt slips on bad hills. The James 3½ h.p. twin is a beautiful solo machine for any kind of weather and country. But the frame needs to be stronger, and the ground clearance is insufficient. Indeed, this may be said with truth of every

machine I have tried out here. The A.J.S. 2¾ h.p. and the Sunbeam 3½ h.p., by reason of their enclosed chains and the clutch, are also first class. The Triumph is, of course, a great favourite, because of its absolute reliability and power of picking up after slowing down for corners and traffic. The B.S.A. and P. and M. are also very well spoken of. Doubtless there are other machines with good records, but as I have no experience of them others must testify to them.

For serious sidecar work at least 6 h.p. is necessary in this hilly country, but in the low country anything from 3½ h.p. upwards will do, provided change speed gears are incorporated. I think most men would agree that for Ceylon the best sidecar machines would include the 6 h.p. A.J.S., the 6 h.p. Enfield, the 6 h.p. Sunbeam, the 6 h.p. Clyno, and the 7 h.p. Indian. An emergency gear is very necessary, a clutch that can be really declutched and yet which will not slip, and chain drive for climbing mountains in wet weather. We need strong frames also, in addition to the better ground clearance mentioned earlier.

The action of the Home Government as regards exports of motor cycles is, I think, open to criticism. Generally speaking, it is very difficult, if not quite impossible, to get either a motor cycle or a car out from home. (This, I hear, does not altogether apply to the B.S.A.) Personally, I have been waiting for a new mount for about nine months, and there are no signs of it yet. The market here is being flooded with American mounts, and as for cars, if it were not for Overlands and Fords our firms in Colombo would have to shut down their import departments, as I was informed by one head salesman. As *The Motor Cycle* urged some time ago, the Government should mount its D.R.'s on foreign machines, and release the home article for home and foreign consumption. It is true that that would be sending money out of the country, but it would be a temporary disability. A.M.W.

The writer of the accompanying article, the Rev. A. M. Walmsley, photographed on a Douglas. This machine gave good service while in Mr. Walmsley's possession.

MOTOR CYCLES ON A TOBACCO FARM.

These pictures were taken on a New England, U.S.A., tobacco farm, where the growers find motor cycles extremely useful for getting about quickly. The left-hand picture shows tobacco leaves strung on a lath. The machines are twin-cylinder Pops.

# MILITARY NOTES.

## THE CONNECTING LINK OF THE CONVOY.

A convoy of British lorries bringing back to rest billets, men who had taken part in the fight for Guillemont. As usual, a motor cycle is in the picture, the two-wheeler proving invaluable for escorting the convoys and keeping the drivers in touch with those in command.

(Official photograph issued for Press Bureau.)

## THE ROLL OF HONOUR.

**E**ACH week it is our regretful duty to record the death, in the service of his country, of some well-known motor cyclist, and this week three men, the names of whom will be familiar to many readers, have to be included.

Lt. F. C. Sangster, Royal Warwicks Regiment, died of wounds received in France on September 6th. He was the

eldest son of Mr. and Mrs. Charles Sangster, of Moseley, Birmingham, and at the outbreak of war he was with the Dunlop Rubber Co., Ltd. He was a keen motor cyclist, his favourite mount being an Ariel, on which he fol-

lowed many trials, and is consequently well known among readers. Sangster joined the ranks in September, 1914, and received a commission at the end of the same year. He was twenty-two years of age.

Lt. George Bax, a well-known Scott rider, and connected with Godfrey and Applebee, Ltd., in more peaceful times, was killed in action on the 7th inst. He was in the M.M.G.S., and had been out at the Front since January, 1915.

We have mentioned Flight-Lt. C. W. Graham, R.N.A.S., once or twice in these columns, and now the announcement has been made that he has been accidentally

killed off the coast of Belgium. We have already recorded how Graham was with the Bosch Co. at Stuttgart at the outbreak of war, and how he was subsequently allowed to leave via Switzerland, his Triumph motor cycle being kept by the Germans at the frontier. He was well-known in Coventry, being a member of the local club, and spent some time at the Triumph works. He was the son of Mr. C. Graham, a director of Brown and Barlow, Ltd.

The late Flight-Lt. C. W. Graham, R.N.A.S.

## TRANSFERS.

**A**CCORDING to a recent Army Command no man may transfer from one regiment to another for his own benefit, but only where it is in the interests of the country.

## HEAT IN MESOPOTAMIA.

**I**N the course of a long letter to his relatives at Tunbridge Wells, Cpl. A. J. Sproston, writing from a hospital in South India of his experiences in Mesopotamia, says that the heat was so terrific that the handle-bars became almost too hot to touch, and the saddle burned the body.

## TECHNICAL CORPS' REQUIREMENTS.

**A** LARGE number of applications from motor cyclists have reached us as a result of the photograph published a fortnight ago showing men in line regiments being tested on a P. and M. motor bicycle with a view to transfer to the R.F.C. Since the photograph was taken, recruiting for motor cyclists has closed, but we are informed by Sec.-Lt. G. E. L. Woodhouse, the officer in charge of the Trade Testing Party stationed at Curzon Hall, Suffolk Street, Birmingham, that men of all engineering trades are required. The pay in each case is approximately 2s. per day. Application may be made to the different centres at which Trade Testing Parties of the R.F.C. are stationed, or direct to the above address.

# Obtaining Best Results from Petrol Substitutes.

## MORE SUGGESTIONS FROM READERS FOR THE EFFICIENT VAPORISATION OF HEAVY FUELS.

**A**MONG the many suggested methods of using heavy fuels sent to us by our readers is a rather novel vaporiser designed by George Mitchell, of

once warmed up the heat will be sufficient entirely to vaporise the paraffin before it reaches the jet, in a similar way to that employed in paraffin blow lamps.

thoroughly heated into the float chamber. To start from cold the petrol is turned on, and after running about 200

Vaporiser designed by George Mitchell.

Sunderland, which has been used, we are told, with success for a considerable time on both cycles and cars. The device consists of a circular chamber let into the induction pipe, through which the gas passes on its way to the engine. Through this chamber runs a number of  $\frac{1}{4}$  in. copper tubes, which are connected to a by-pass from the exhaust, and are consequently heated. These hot tubes form a baffle through which the charge has to pass, and any un-vaporised particles of fuel are soon changed into gas. In order to render the vaporising effect more efficient, the tubes are surrounded by a band of gauze.

Mr. Mitchell tells us that he has used the system of introducing petrol via a drip feed valve into the induction pipe for starting purposes for a very long time, but he finds that it is more satisfactory to have a small pilot jet, as shown in the sketch, the supply of petrol being turned on or off at will, the small jet regulating the quantity.

### Another Suggested Paraffin Vaporiser.

Another suggestion for satisfactorily converting paraffin into a perfect vapour has been sent to us by E. W. Hayes, of Sandford Road, Dublin. His idea is that the fuel should issue from the jet in the form of vapour, and not as an un-vaporised spray which must be converted into vapour as well as mixed with air some time between leaving the jet and entering the cylinder. As the latter is somewhat difficult to ensure in so short a distance, the chances are that quite a considerable proportion of the heavy paraffin spray reaches the cylinder without having been vaporised.

Mr. Hayes's plan is to separate the spray and float chamber of the carburettor, and re-assemble the two units in their correct relative positions on each side of the exhaust pipe. The fuel is then led from the float chamber via a copper pipe, which is coiled a number of times round the exhaust pipe, to the jet situated in the usual mixing chamber. The idea is that when the engine is

The paraffin vapour thus obtained is then converted into a proper explosive gas by mixing with air in the usual way. All the air should be drawn from the neighbourhood of the exhaust pipe, and the inlet pipe lagged with asbestos to prevent heat radiation and consequent condensation. The engine is started by means of petrol from an auxiliary tank, or the vaporiser coil may be heated from an outside source, such as with a blow lamp. It is also

suggested that the float chamber could be done away with altogether and the fuel supply regulated with an adjustable needle valve, as in some vapour lamps.

### In Place of the Exhaust Valve Cap.

The next device is one devised by an officer in the R.F.C.—Sec.-Lt. E. B. Morgan—and a correspondent, E. W. Plumridge, has tested it for about 1,000 miles on a 1914 Triumph sidecar.

The exhaust valve cap is removed, and the vaporiser, a small gunmetal chamber, takes its place. A small tank to hold petrol is placed upon the top tube, the ordinary tank being filled with paraffin; the two supplies are fitted with Y copper tubing to the carburettor. The paraffin is taken from the main tank into the vaporiser, and then passes

Sec.-Lt. E. B. Morgan's design.

yards it is turned off, and the machine runs on paraffin.

The only alteration made other than the fitting of the vaporiser and tank is that the ignition has been retarded.

Heavy fuel vaporiser patented by our correspondent, W. Parker. (See description on this page.)

The oil in the crank case has been tested several times, and there was no suspicion of paraffin having leaked past the piston rings. Furthermore, upon removal of cylinder there appeared no more carbon deposit than if petrol had been used. A consumption test of thirty-five miles was made, when the average miles per gallon on paraffin worked out to 99, against 75-80 on petrol.

### A Device giving Good Results with 75% Paraffin.

The vaporiser shown above consists of a threaded tube, on which are screwed fins. It is then inserted in the induction pipe, the two end fins gripping the ends of the pipe, and so keeping it in position. Each set of fins is fixed out of line with the previous one to split up the fuel. There is a sleeve on the induction pipe to conduct heat from the engine. A hot air intake pipe is used.

W. Parker, who is responsible for the design, tells us that he has tested the vaporiser for a considerable time with satisfactory results with all paraffin and various mixtures, finding 70% to 80% paraffin an excellent fuel.

A suggestion by E. W. Hayes.

# Obtaining Best Results from Petrol Substitutes.

Another correspondent, "BI 172," sends a sketch (reproduced herewith) of a device which has given satisfaction with a mixture of two-thirds petrol and one-third paraffin. He writes: "I made a hollow cone of copper wire gauze and soldered a flat circular piece of gauze on to the small end of it. The large end of the cone is slipped into the inlet pipe (in which it is a good fit), and the flat circular piece of gauze, which is the same diameter as the out-

The method adopted by "BI 172" for using heavy fuel.

side of the pipe, butts against the end of the latter, and the carburettor holds it in place. I have removed the gauze screen from the air intake on the carburettor and used an old piece of flexible brass motor horn tubing to bring warm air from the engine.

"The carburettor is a B. and B. variable jet, semi-automatic, and I have made no alteration to the level or jet: it is exactly as sent out by the makers. I find I can get about 160 miles to the gallon of mixture (two-thirds petrol and one-third paraffin), or at the rate of about 240 miles per gallon of petrol. The machine runs as well as with all petrol, except, perhaps, a slight tendency to knock on hills and rather poorer acceleration. The carburettor is no doubt set somewhat on the economical side, but there is ample power for ordinary use. I usually run about a couple of miles on petrol, and when warmed up turn on the mixture.

"The machine is an Edmund spring frame with 2½ b.p. J.A.P. engine, and the double tank and two-way cock; standard on this machine, make it very convenient for heavy fuel tests."

A Douglas engine adapted to run on petrol substitutes. See description on page 225 of our last issue.

# A NEW SPRING FRAME.

## A Departure from the Ordinary Type.

WE have repeatedly called attention to the need for spring frames and encouraged their development by describing the systems devised by our readers. *The Motor Cycle* campaign, though heartily received by the riding

A novel machine designed by J. C. Maude incorporating rear springing in which the laminated springs form the chain stays.

public, makes slow progress among manufacturers. During the past two and a half years we have published details of no fewer than eighty-two designs of spring frames, and many of these have been worthy of more than casual attention; still manufacturers, with few exceptions, ignore the great demand for increased comfort.

Maude system of springing adapted to an ordinary type of frame.

We illustrate a design patented and protected under Patent No. 11,968, by Mr. J. C. Maude, Coventry, which embodies

Alternative methods of rear springing patented by J. C. Maude. (Upper) Where the spring is not mounted rigidly to the main frame, but is carried on two links, giving "parallel ruler" motion. (Lower) Ordinary cantilever suspension.

several drastic departures from the usual pattern of frame. It will be seen to consist of a kind of cradle of two tubes, sloping downwards from the head, to carry the engine between them; a vertical support for the front of the seat and a triangular back fork, the base of which is a cantilever spring, the apex being a pivoted support for the back of the seat. An alternative method of springing is shown, where a grasshopper type of spring takes the place of the cantilever. In this instance two hinged torque rods are incorporated, which should greatly improve the rigidity of the frame.

The inventor already has a machine of this design running on the road, and the further developments will be watched with interest.

## Average Prices OF Second-hand Machines.

WE give below the average prices of second-hand models offered for sale in *The Motor Cycle*. Where it is possible to obtain a sufficient number of each model the average for the past week is quoted, otherwise the last average is given, if within five weeks.

### Taking Motor Cycles to Ireland.

We are informed by the Touring Department of the Royal Automobile Club that there are no restrictions, and never have been any, concerning the shipment of motor cycles to Ireland, and there is no difficulty about bringing them back again into this country. This point was raised by a military reader of *The Motor Cycle*.

### Analysing Petrol Substitutes.

It is reported that the Petrol Control Committee has taken samples of many petrol substitutes, and is having them analysed. If it were discovered that a substitute contained petrol, it would be interesting to know who would be liable to a fine. The purchaser could not be blamed unless it could be proved that he knew it contained petrol.

### Prospective Mayor of Coventry.

Mr. A. S. Hill, chairman and managing director of the Coventry Chain Co., Ltd., and chairman of Bluemel Bros., will fill the office of Mayor of the City of Coventry for the ensuing year. It is only fitting that the principal motor manufacturing centre of the country should have as its civic chief a man closely in touch with the city's principal industry.

### Carburation. What is it?

Every motor cyclist knows that when his engine goes faster or slower he has to open or close the air lever to suit the speed. Many know why this has to be done, but all are not so conversant with the phenomenon of carburation. In yesterday's (Wednesday's) issue of *The Light Car* is an article which explains the action of a single lever automatic carburettor, and shows the difference between this type and the two lever pattern fitted to nearly all motor cycles.

### Something Not New.

Under the heading, "A New Motor Engine," *The Times* printed the following paragraph the other day: "According to the *Nationaltidende*, an inventor named Ellesammer has succeeded in constructing a carburettor making it possible to use benzol instead of petrol for motor engines." We congratulate *The Times* on this wonderful discovery. It seems possible that alcohol is meant, and that the inventor is probably Elleham, who manufactures the only motor bicycle turned out in Denmark.

B12

## SPECIAL FEATURES

1,500 MILES WITH A 1916 TRIUMPH  
A SOUTH AFRICAN DESPATCH RIDER IN "GERMAN EAST."  
OBTAINING BEST RESULTS FROM PETROL SUBSTITUTES.

### No Regulations Against Substitutes.

It was officially announced at the end of last week that the Petrol Control Committee has no intention at present of making any restrictions in the use of petrol substitutes.

### Steam Rollers to Spare.

It is reported that there are in Warwickshire twenty-five steam rollers lying idle, as drivers cannot be obtained. This is a pity, for we know of many roads where their services could be employed.

### A SEA-BATHING DIVERSION—A FAIR AMERICAN AUTO-PEDDING ON THE SANDS AT LONG BEACH.

The Auto-ped, an American idea, is not unknown to our readers, as it was illustrated in these pages some twelve months ago. It is propelled by a small single-cylinder engine, and the machine illustrated will be seen to be complete with head and tail lamps and warning bell. It resembles in general outline the motor "skicycle" described and illustrated in *The Motor Cycle* of July 20th last.

**Motor Cyclists Killed.**

Three well-known motor cyclists must be added to the growing Roll of Honour. Their names appear on our Military Page.

**A Government Type Mount.**

Our experiences with a War Office model Triumph—one of the first produced with the new type semi-T.T. handle-bar—over a distance of 1,500 miles appear in this issue.

**The "Hush Hush" Brigade.**

Since our last issue appeared the new heavy armoured cars have been in action and proved, according to General Sir Douglas Haig, of considerable utility. The men manning these cars were recruited through the columns of this journal.

**Wonderful Vehicles.**

All the men have technical knowledge. The "tanks"—as the soldiers call them—are destroyers on wheels, and, of course, a petrol engine is the motive power. It was mentioned in these columns three weeks ago that H.M. the King and Mr. D. Lloyd George had witnessed a private demonstration of the section. A great deal more will be heard of these cars.

**Petrol Substitutes—Possible Restrictions?**

It is wonderful what carburettors will vaporise. We never dreamed a year ago that our engines would consume anything but No. 1 or No. 2 petrol. Taxibus was sniffed at, but these days we are glad to get anything to help eke out the meagre allowance of efficient fuel the Petrol Committee allows us. And now there is talk of taxing all that is left to run on, and of not allowing us to buy our white spirits or paraffin—which is no spirit at all—without first entering the sale on our petrol tickets. And the reason for this state of affairs is mostly due to the meddlesome interference of certain half-penny evening papers.

**New Australian Records.**

We are informed that Jack Booth, the crack Victorian rider, has set up near Melbourne new times for the one, five, and ten miles records. Booth usually rides a Castrol lubricated Indian, and further particulars will be awaited with interest.

**Admiral Arbuthnot Trophy Fund Closed.**

The Admiral Arbuthnot Trophy Fund, which now amounts to a total of £212 2s., has been closed. The latest subscriptions to be received are the following:

Swift Cycle Co., Ltd.	£5	5	0
A Medical Motor Cyclist in Mesopotamia	10	6	
Sec. Lieut. Glynn Rowden, R.F.C.	5	0	

**Illusive Orders.**

For the last few weeks rumours have been current in the Midlands regarding tenders for thousands of motor bicycles for some mysterious Government. The matter got further than a tender last week, an order for thousands, we were seriously told, having been placed with a leading Coventry firm. Enquiries of the firm named revealed the fact that the suggestion was as great a surprise to the directors as the new heavy armoured cars were to the Germans!

**The Jutland Battle Honours.**

We note with pleasure that His Majesty the King has been graciously pleased to approve of the posthumous honour of Knight Commandership of the Most Honourable Order of the Bath being conferred on the late Rear-Admiral Sir Robert Keith Arbuthnot, Bt., C.B., M.V.O., killed in action on May 31st, 1916, in recognition of his services mentioned in the despatch relating to the Jutland battle. Coupled with Sir Robert's name is that of Rear-Admiral Hood. Referring to these two gallant gentlemen, the *Daily Mail* of Saturday says: "Who, friends in life, were not divided in death, and both fell setting an immortal example to their country."

**Selecting a Second-hand Light Car.**

Any reader who may think of purchasing a light car would do well to read an article on the subject in *The Light Car* published yesterday (Wednesday). In it useful advice is given on the points to examine for wear.

**Shows of Second-hand Machines.**

All arrangements are now complete for the holding, during the coming winter, of shows of second-hand motor cycles and cars in London and Manchester, and it is expected that similar shows will be held next spring in Scotland and Ireland. Particulars appear on page 255 of this issue.

**The Principal National Funds.**

At the week-end the principal war funds stood as follow:

Prince of Wales's National Relief Fund (£3,463,925 distributed)	£5,953,938	0	0
The Queen's Work for Women Fund	170,547	0	0
Tobacco Fund	114,074	0	0
Red Cross Fund	4,359,518	11	7
Lord Kitchener Memorial Fund	289,000	0	0

**Improved Roads on Salisbury Plain.**

That some roads have improved of late is indicated by the writer of the article on page 239 of this issue, describing a visit paid recently to Salisbury Plain. According to the writer in question, it will be noted that many of the roads in this quarter have been re-made and are now in first-class condition.

**A Sweep in Western Australia.**

We are informed that H. V. Norton, a name well known in Western Australian motor cycling circles, has recently won in four consecutive events the track championship, petrol consumption trial, two days' reliability trial, and hill-climb. Norton used the same machine (B.S.A.) for each competition.

**Birmingham Chamber of Commerce.**

The Midland Metropolis has always been known for its keen business instincts, and one of the best schemes it has launched is the recently inaugurated Chamber of Commerce development scheme. £50,000 is required for the establishment of a big house of commerce worthy of the city and district. Towards this sum over £22,000 has been subscribed, and further donations should be addressed to the President and Council, Chamber of Commerce, Winchester House, Victoria Square, Birmingham.

**Birmingham Wounded Soldiers' Outing.**

A number of Birmingham motor cyclists entertained about thirty wounded soldiers from Lightwood Hall to another sidecar outing on Sunday last. The trip was to Stratford-on-Avon, where a steamboat trip was arranged, after which tea was provided. The return journey was undertaken in the rain, but was nevertheless successful.

A further outing has been arranged for next Sunday, 24th inst., and Stratford has, by special request, again been selected as the objective. A start is to be made from Lightwood Park at 10 a.m. It is proposed to have an outdoor lunch, which will be provided by the hospital, while the motorists will arrange for the tea. All motorists who would like to assist are welcome, and should arrive at Lightwood Park by the Beet Lanes entrance.

**SHREWSBURY WOUNDED SOLDIERS' SIDECAR OUTING.**

Photograph taken on the occasion of the third fortnightly Sunday run organised by Shrewsbury motorists. About sixty convalescent men were taken in sidecars and cars for a very enjoyable run.

## Wounded Heroes Enjoy a

Some of the sidecars in a pretty setting in Stoneleigh Park.

ARRANGED by the staff and employees of the Triumph Cycle Co., Ltd., the outing for wounded soldiers injured in the Somme battle, held on Saturday last, proved highly successful. The day was an exceptional one, brilliant sunshine following two or three days cold. Needless to remark, the pleasant atmospherical conditions added considerably to

the enjoyment of the wounded heroes and the success of the whole affair.

After picking up the passengers at the different local hospitals, the motorists assembled on an open space adjoining the Triumph Works, and, after the photograph had been taken, the imposing procession of vehicles, consisting of over fifty sidecars and fifty cars, departed for a twenty mile trip in different directions through the lanes of Warwickshire,

arriving about four o'clock at the old Deer Park, Stoneleigh. The use of the park had been granted by the Right Hon. Lord of the Triumph Co. Leigh addressed a f

READY TO START FROM COVENTRY. A huge fleet of sidecars and cars—about fifty of each—were used, the

Group of the wounded soldiers for whose benefit the trip was arranged.

who is chairman  
the marquee Lord  
of welcome to

the soldiers, expressing his confidence in a  
thorough victory for the Allies. From the  
knoll on which the marquee was placed a

magnificent view of the Abbey grounds was  
obtained. Leading to the knoll was a grass  
bank having a gradient of about 1 in 4, and

testers of the Triumph Co.,  
who had patrolled the route  
covered by the cars and  
assisted in minor troubles,  
besides politely showing the  
way, sustained the interest  
of the soldiers by showing  
what a modern motor cycle  
can do on such a precipitous  
bank. First one, then two,  
and finally three passengers  
were carried, while, to the  
great delight of the lookers-  
on, two of the men rode up  
standing in the saddle, and  
another actually attempted  
to ride his machine up  
backwards. He got half  
way, having difficulty in  
steering a straight course on  
the rough track. Subse-  
quently a number of games  
were held, the men taking  
part with zest. A start for  
home was made at seven  
o'clock, the trip having been  
greatly enjoyed, and likely  
to be remembered.

being arranged by the workpeople and staff of the Triumph Cycle Co., Ltd

## THE NEW ARMoured CARS.

Some Details of the Twenty Ton Caterpillars used in the Somme Battle.  
Men Recruited and Examined by the Editor of this Journal.

Some men of the Heavy Section, Machine Gun Corps, who have given the Germans such a surprise with their armoured cars.

**T**HE secret is out! The British official communiqué on Friday afternoon last contained this statement:

"In this attack we employed for the first time a new type of heavy armoured car, which has proved of considerable utility."

The vehicles referred to are of secret construction, but they are of particular interest to readers of *The Motor Cycle*, as they form the equipment of the Heavy Section Machine Gun Corps. This section was recruited through the columns of *The Motor Cycle*, and many readers have friends attached to it. It is only three weeks ago that we referred to the fact that H.M. the King and Mr. D. Lloyd George had made private inspections of the section. As stated above, the vehicles forming the equipment are of secret design, and when it is possible to lift the veil men with mechanical instincts will be immensely interested. Suffice it to say that they can best be described as travelling forts. The men on the cars are entirely enclosed and protected by thick armoured plate, from which shrapnel and machine gun bullets bounce off harmlessly. The forts simply bristle with machine guns, and, as *The Times* says, one can imagine the feelings of the German infantry in their shell-battered trenches when in the uncertain light of dawn they see advancing upon them an array of unearthly monsters cased in steel, spitting fire and crawling laboriously but ceaselessly over trench, barbed wire, and shell crater. The cars, which are known as "tanks" and "Willies" among the men who handle them, are propelled by a very powerful petrol engine.

When it is mentioned that the armoured cars weigh well over twenty tons, it will be gathered what amount of petrol is disappearing. Naturally, ordinary wheels would never be able to perform satisfactorily over stretches of ground shell torn, roadless, and intersected with trenches. The armoured cars in question move on Caterpillar wheels, adding to their awesome appearance. It is marvellous to see them operating; they climb up a hill just like a caterpillar, poise on the top, and come down the other side like a thing of life. Should a tree, or even a house, stand in their way, the car simply fells it and tramples over the debris.

Hats off to the men of the Heavy Section Machine Gun Corps for their successful *début*, and for having already earned the praise of General Headquarters!

### Whose Idea?

"What about the new 'tanks?'" Mr. Lloyd George was asked by a pressman as he was leaving the War Office yesterday.

"Well," replied the War Secretary, "we must not expect too much from them, but so far they have done very well."

"And don't you think," he continued, "that they reflect some credit on those responsible for them? It is really to Mr. Winston Churchill that the credit is due more than to anyone else. He took up with enthusiasm the idea of making them a long time ago, and he met with many difficulties. He converted me, and at the Ministry of Munitions he went ahead and made them."

"The Admiralty experts were invaluable, and gave the greatest possible assistance. They are, of course, experts in the matter of armour plating. Major Stern, a business man at the Ministry of Munitions, had charge of the work of getting them built, and he did the task very well. Col. Swinton and others also did valuable work."

"You see," remarked Mr. Lloyd George, in conclusion, "the enemy has by no means a monopoly of inventive ingenuity."

We give below some press correspondents' descriptions of the new armoured cars in action:

Mr. Percival Phillips, in *The Yorkshire Post*:

I heard the fragment of one conversation as a grievously wounded man was lifted out at a casualty clearing station . . . and he says, "Lord, there was one of them iron boxes strolling down the high street of Flers like it was Sunday afternoon." The man who invented these new and efficient machines of destruction deserves much of the Army, if for no more than he has made it laugh as it fought—not the laughter of ridicule, but of admiration.

*Pall Mall Gazette*:

Truly amazing is the story of the part played by the new heavy armoured cars, or "tanks," as they are called, in the recent British advance on the Somme front. The feats they accomplished sound like incidents from fairy tales.

Here in brief are some of the accomplishments as described by various correspondents:

It "leant" against a broken wall until it fell, and then crawled over the debris.

It went irresistibly through High Wood, the trees smashing like matchsticks before it.

It went up to machine gun emplacements, "crushed the gun under its ribs," and passed on, spitting death at the demoralised Germans.

It "stamped" down a dug-out as though it were a wasps' nest.

It "sat on" heaps of ruins and fired down a village street.

It went right through the old German trenches.

It crashed through broken barns and houses, "straddled" a dug-out, and fired enfilading shots down German trenches.

It put a battery and a half of guns out of action near Flers.

## THE LATEST DUNLOP. Combination Steel and Rubber Studded Tyre.

THE pros and cons of the question, rubber tread *versus* steel studs, have given rise to endless argument, and there will always be many adherents to both sides. If any decision is arrived at it usually takes the form of a compromise, the combination of steel and rubber studs in one tyre; the advantages

of the one counteracting the disadvantages of the other; when the rubber would slip the steel holds the road, and *vice versa*. To those motorists, and they are numerous, who favour this type of cover will come as a pleasant surprise the decision of the Dunlop Rubber Co., Ltd., to market a combination cover in several sizes for motor cycles and light cars.

The construction is somewhat similar to the usual rubber-studded cover,

Dunlop combined steel and rubber-studded cover.

with additional layers of canvas and rubber on the tread to support the steel studs. These are fixed in such a way as to make them almost impossible to pull out. On the new tyre the rubber studs stand slightly higher than the steel studs, so that when the weight is on the tyre both kinds will be equally in contact with the road surface. The thickness of material on the tread is abnormal; on the section before us it measures  $\frac{3}{4}$  in. thick, and it should be practically impossible to puncture. This cover should make an ideal sidecar tyre on account of its sturdiness. It is to be made in four sizes for motor cycles, 26 in.  $\times$  2  $\frac{1}{2}$  in., 26 in.  $\times$  2  $\frac{1}{2}$  in., 26 in.  $\times$  3 in., and 650  $\times$  65 mm. (also for light cars, 700  $\times$  80 mm. and 700  $\times$  85 mm.). A number of tyres are already in use on the road, and are giving every satisfaction. It is doubtful whether this cover will completely oust the older all-rubber stud and all-steel stud types, but it is certain to find many admirers, and should have a big future.

## GRAPHITE FED VIA THE INDUCTION PIPE.

GRAPHITE has always been recognised as an almost ideal substance for the lubrication of the cylinder walls of any internal combustion engine, especially where great heat exists, as in an air-cooled motor. Considerable difficulty, however, has occurred in introducing it into the lubrication system in a convenient manner. Many dodges have

been tried with more or less success, such as suspending it in the lubricating oil and so on. A device which, we understand, is quite successful is the Woolf graphite lubricator, which originates from America, and is handled in this country by Messrs. Jarvis Bros., of Middlesbrough. It consists of a small

The Woolf graphite lubricator for introducing fine flake graphite into the cylinder via the induction pipe.

receptacle for the graphite very similar to an ordinary screw-down greaser. This is screwed into the induction pipe of the engine, so that the lubricant is supplied with the mixture direct to the cylinder and piston, the parts of the engine which benefit most by the graphite lubrication. In the neck of the lubricator is fitted a tap; this tap, however, is really a measure, it being a hollow plug with a hole at one side which registers with the graphite receptacle, and is so filled with the lubricant. Upon the handle being turned the hole registers with the outlet to the induction

pipe, and the engine suction draws the small particles of flake graphite into the cylinder with the mixture. This operation, we understand, need only be done once in fifty miles. Of course, this system does not replace the ordinary lubricating oil, but merely augments it, and is claimed to provide perfect lubrication for the cylinder walls.

## SHOW OF SECOND-HAND MACHINES.

AS already announced, a proposal is on foot to hold a show of second-hand motor cars and motor cycles at the Royal Agricultural Hall, London, from November 10th to 18th of the current year, and also at the Royal Botanical Gardens, Manchester, from December 1st to 9th. Similar shows, we are informed, will be held in Scotland and Ireland in the spring of 1917. The organisation is in the hands of Messrs. William Glass and Co., Lincoln House, High Holborn, London, W.C. Anyone deciding to send his machine for sale at this show should communicate with the secretary of the company in question. The cost of space for exhibiting will be reckoned at 2  $\frac{1}{2}$  % of the selling price under £200, with a minimum of £1 5s. for motor cycles and £2 for sidecars. The price includes entry in catalogue, certificate, insurance against fire, whitening tyres, and dusting the machine during the show. The exhibit, however, must be delivered clean. If the machine is sold a commission of 2  $\frac{1}{2}$  % is charged on the said price (5% in all). Each exhibit will be examined by a qualified expert, and a certificate will be attached to the exhibit setting forth its condition, thus protecting the purchaser against misrepresentation.

## SIR HIRAM MAXIM TO THE RESCUE!

The veteran inventor has turned his attention to the petrol supply problem, and is now engaged upon experiments with a view to rendering paraffin suitable for motor engines.

### Buying Oils in Bulk.

Sir,—Since 1913 we have consistently advocated in our advertisements in your widely read journal the economy of purchasing motor oil in bulk, say five-gallon drums, instead of in comparatively expensive small tins.

Your contributors have frequently pointed out that nowadays this matter is of particular importance, and we may mention for your possible information that the Government are exercising control over the output of "tin plate" from which tins are manufactured.

Nevertheless, we regret to have to advise you that there are cycle and motor dealers here and there who cannot or will not see this aspect of the question, and who press small tins on the customer requiring a drum. Surely the dealer must realise that sooner or later his customer will go elsewhere for his supplies.

*The Motor Cycle*, we find, is read almost as much by the trade as by motor cyclists, and we venture to think that this letter or a note on similar lines will do good.

PRICES' CO., LTD.

### Decarbonising on Active Service.

Sir,—We have just had the pleasure of perusing the pages of our old friend *The Motor Cycle* of August 24th, and note with particular interest the photograph of S. George and his accompanying remarks, which appear on page 160.

We say "with particular interest" because we are Royal Flying Corps despatch riders ourselves, though, unlike S. George (who is at a base depot), we are with a squadron in an advanced position. As you are aware, the P. and M. is universally used throughout this corps, and it is only because we have had experience extending over fourteen months out here that we venture to criticise the statement of such an expert as S. George. Considering the poor quality of the juice that all branches of the M.T. use out here, it is impossible for any engine to do 30,000 miles without thorough overhauling.

We say nothing against the P. and M. engine; in fact it is probably the most reliable out here, but, apart from the motor cycle, it is doubtful whether the man could, physically, attain such a total in something under eight months.

We shall watch the pages of your paper with keen interest for further remarks on this great "record."

1st A.M. MAYO, No. 4162.

1st A.M. MORDUL, No. 4143.

1st A.M. SALMONS, No. 6278.

B.E.F., France.

### Short Measure of Petrol.

Sir,—Regarding Mr. Sidney J. Williams's letter published in *The Motor Cycle* of the 7th inst., we heartily agree that some step should be taken to enforce the correct measure being supplied by the petrol companies. We, in common with other garages, are hit hard by this shortage, because when we have to open a two-gallon can to supply, for example, half a gallon at a time, we find that the fourth measurement is, seven times out of ten, short of what it should be. This we have to make good out of our most princely margin of profit by opening another can to make measure.

The best solution of the problem is to purchase petrol in bulk and store underground in a tank with meter, but every-

## LETTERS to the EDITOR

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

one cannot do this. Even if the two-gallon cans were filled under some system of Government supervision, the question of leaky cans crops up. Here is another case where we have to make good any under-measure, because the petrol companies will not now exchange faulty cans, and if we do not exchange such cans we lose custom.

We should like to see opinions of other garages on this matter.

JUICE RETAILERS.

Yelverton.

[Is not this question one demanding the investigation of the Motor Trade Association?—Ed.]

### Silent Discharge.

Sir,—I was extremely interested to read "Ixion's" notes in your issue of September 14th on the causes of overheating and his references to sparking plugs. His remarks confirm my own experiences. These are not confined to one make of machine, but extend to many, the same thing having happened with a 2½ h.p. New Imperial, a 2½ h.p. twin Forward, a 3½ h.p. twin James, a 3½ h.p. Premier, a 3½ h.p. B.S.A., a 6 h.p. twin A.J.S., and a 6 h.p. twin Enfield. In each case, by running for a mile or so on anything over half throttle, the engine would come to a standstill, though it would, as "Ixion" also remarks, restart almost immediately. In some cases I have found that even the momentary lifting of the exhaust valve would reproduce normal firing. Like "Ixion," I, too, have a few rusty old Bosch plugs, relics of T.T. races, and the fitting of one has invariably produced the result that my engine would continue to run on a large throttle opening. It has been most important to me that an engine should so run, as I have done a tremendous amount of riding in connection with carburetter designing. It was essential that I should know why this pulling up occurred, whether it was due to carburetter, ignition, or oiling, and I have proved, conclusively enough for myself, that in every case it has been due to plugs. 1.

### THE SPORTSMAN'S MOUNT.

A good catch—54 lb. of fish caught before nine o'clock in the morning, thanks in part to the Zenith sidecar, which enabled Mr. O. B. Geake, of Tunbridge Wells, on the left, and his friend to get to the scene of operations with the least delay. The Zenith is two years old, and Mr. Geake reports no trouble during this period.

have used five or six different types of British ones, with the same result in each case. I have taken out the British and put in the Bosch, the trouble at once disappearing, only to recur when the other plug was returned.

I have not, so far, carried out any experiments for the purpose of ascertaining what happens or what the precise cause is, as I have been working on carburettors, and it was sufficient for me to know that it was plug and not carburettor trouble.

My reason for writing is to bring forward a little more evidence that our plugs are not yet perfection. It is only when the faults in an article are known that they can be eradicated.

HAROLD J. COX.

Sir,—The question raised by your correspondent in this connection is a rather novel one, and I agree with "Ixon" that an expert opinion on the subject would be useful.

My physics are very rusty, but I am quite willing to "butt in" in the hope of enticing one of "Ixon's" "size 8 hats" into the arena.

One of the principal properties of a radio-active substance is its power of rendering air a partial conductor by ionisation. It was this property, I believe, which led to the discovery of radium. According to one theory radio-activity is caused by disintegration of the atom, brought about by the speed of its component particles rising above a certain critical value.

I think experiments showed most of the common metals to be radio-active to a light degree, and, as heat has the effect of accelerating the speed of vibration of an atom, it seems quite reasonable to suppose that a metal becomes more radio-active as its temperature rises.

If it does, it is probable that at a certain temperature the metal forming the points of a sparking plug becomes sufficiently radio-active to ionise the gas between the points and produce the "silent discharge."

Perhaps your correspondent could tell us whether an engine liable to the mysterious drying up he mentions is also subject to pre-ignition knock, i.e., is the temperature producing the supposed "silent discharge" higher or lower than that causing pre-ignition?

London, N.W.

P.C.K.S.

#### American Motor Cycles.

Sir,—Referring to the correspondence on American motor cycles, Captain Lindsay has indeed "hit the nail on the head," to use a somewhat hackneyed phrase. All such machines which I have come across were very fine for three months, passable for six, but hopeless for a year's hard work.

In your issue of September 7th, D. H. Smith, M.T., A.S.C., in speaking of his "leading" single, makes a slight error. Among his leading singles Captain Lindsay mentions the  $3\frac{1}{2}$  h.p. "All-British" Norton. It was *this* engine which set the fashion in the motor cycle world, and Norton engines were manufactured before a complete machine was made.

I would point out to Mr. Smith that his leading single adopted the long stroke and large valve idea a matter of two years ago, and this has *always* been the great Norton feature. The machine for greasy road work is the  $3\frac{1}{2}$  h.p. Norton. On my  $3\frac{1}{2}$  h.p. T.T. machine I have covered 7,000 miles since July, 1915—trouble nil. Need I add the usual disclaimer?

JOHN W. WALKER.

Sir,—I would like to reply to Mr. D. H. Smith's letter (September 7th, page 210), as he apparently does not approve of my personal short list of good things. I would point out that I also have ridden every model of his "leading single" since 1907, excepting a 1909 one, and I am at present using a 1916 model in the war zone. I shall be pleased to give him any information about it. None of the machines mentioned in my list can be accused of being copies. Each one has been a distinct advance on the "policy of conservatism," which is, in my opinion, not the policy for the British motor cycle industry to take up just yet in the face of a coming Overseas trade war. The result of this policy is seen most clearly in our Overseas Dominions, where America is gaining ground rapidly. I am afraid I buy my leading single from the other 15%, who do not copy but lead. Only a short two years ago saw a (Mr. Smith's) "leading single" become the copyist.

My leading single was offering the short-sighted public a countershaft two-speed chain-drive machine two years before

his leading single was offering a fixed gear belt drive. The bulk of the single-cylinder market is, however, slowly, but surely, coming into line with the machine I have in view. One by one the people who formerly derided the long-stroke engine most violently are producing long-stroke engines without a blush.

With all due respect to Mr. Smith, I think I will stick to my short list—a list I have drawn up from riding experience, not prejudice.

Adding the usual disclaimer,  
B.E.F.

A. LINDSAY (Capt.), R.G.A.

Sir,—Capt. Lindsay in your issue of the 31st ult. makes many dogmatic assertions anent American motor cycles. Does he speak from practical experience, or is his opinion only the result of an intolerable bias? I have never been astride a "single," but if I allowed my intense appreciation of the (to me) undoubted superiority of my American twin to lead me into equally intense disgust with the untried single it would be an easy matter to give vent to sarcasm. I have lately taken delivery of a 7.9 h.p. Harley-Davidson model 16 F with sidecar, and I can assure Capt. Lindsay it is anything but an "over-engined crudity" (a most narrow-minded sarcasm).

Taking Capt. Lindsay's points in turn:

1. Twist grip control.—Which is easier, a twist of the wrist with a firm grip of the control, or holding the handle-bar grip with two fingers and a thumb, and manipulating two levers with the rest of the digital members.

2. Kick starters.—Are American kick starters any more crude than British? I trow not, if one's eyesight can be depended on not to transform an English machine into an American whenever a perspiring motor cyclist is "doing time" on the kick starter!

3. Constant attention is no more demanded by American machines than English. Will Capt. Lindsay tell us what attention the American machines demand that the English do not? The boot is on the other foot, to some degree, too!

4. Automatic carburettors.—If they are not automatic, what on earth are they? Anyhow, they do give a decent "tick over" in free engine, which is not the fact in the case of the average British single from my observation.

5. It is to be hoped Capt. Lindsay does not think his opinion to be so infallible that his list of machines may be taken as complete or authoritative. How many of these machines has he actual prolonged riding experience of?

May I briefly enumerate the special points about my particular "crudity" which appeal to me, and are not usually found in the average British machine? Substantially built all round, including carrier, mudguard and stays to same, silencer. Rigidly assembled (no rattle). Practically impossible for steering column to alter relative position to handle-bars. Automatic lubrication: this alone has, to me, increased the pleasure of riding beyond all expectation. Oil reservoir, ample for a five hundred miles tour with sidecar. Clutch which may be slipped indefinitely; British makers usually demur at such treatment. Substantial gear box. Interlocking of clutch and gear controls. Large wheels and 3in. tyres. Automatic carburetter, easily adjustable for either economy or power (see *The Motor Cycle*, December 2nd, 1915). Sensible spring saddle. Large filler caps. Carrier which *will* carry. Loop frame. Gear box on, instead of hanging to frame. Powerful brakes without unsightly belt rims for friction surfaces. Mechanical crank case release of large diameter. Really efficient silencer. Sheet metal tool box neatly mounted. Enclosed overhead inlet valves. A goodly array of crudeness!

Usual disclaimer in full.

J.W.

#### The Scott Sociable.

Sir,—I think the offence given to some people by the appearance of the Scott Sociable is caused partly by the projecting radiator cover. The radiator could be in full view with a plated or dull top of neat shape.

To draw a larger sale, perhaps the plan of fitting at option a reputable air-cooled four-stroke engine might be effective. We know everything else on the car will be all right, but there will always be two opposing opinions on the two-stroke engine, even if it is a Scott with distributing valve.

An air-cooled engine would allow of the front being finished off like a sidecar, which, in my opinion, is distinctly graceful when it is a Canelet or similar pattern. A

projecting cylinder on the off side would not be objectionable, provided the oil oozing from tappet guides were hidden.

I agree with "Sidecarist" in the issue of September 14th, but I cannot believe that the price will be much, if any, less than £100, and most people will want 75 m.p.g., which is probably impossible of attainment by a 550-600 c.c. two-stroke twin in a car for two. W. R. DEUCHAR.

#### Petrol Substitutes.

Sir,—Referring to Mr. Binks's reply to "CW 45" in your last issue, Mr. Binks gives as his only excuse for the sudden increase in the cost of his fuel that the freights have increased enormously. Now, in May this fuel was being sold at 1s. 3d. per gallon; at present the cost is 2s. 6d. per gallon. Allowing that two gallons of the fuel weigh roughly 15 lb., this means that in the last five months the freight from California has increased by nearly £19 per ton. H.J.L.

Sir,—Seeing the letters *re* Binks fuel, I think my experience will be of interest. I sent cheque for barrel of fuel and three jet carburetter nine weeks ago. I received the carburetter in seven days, but the fuel has not yet come to hand after nine weeks. At the end of July I received a postcard advising me that the fuel had left their wharf and would take the railway company ten days to deliver. After waiting nearly another three weeks I advised Messrs. Binks that the fuel had not come to hand and asked for an explanation, but my letter was totally ignored. Therefore, after waiting still another two weeks I wrote again, and this time received a reply saying that they were absolutely helpless in the matter and could not say when they would deliver. W.M.F.

Sir,—Seeing a complaint from "C.W." concerning Binks fuel, I, too, have a complaint which also should be made public, and by so doing may get a more satisfactory answer from Messrs. Binks than I have been able to do. On April 18th I ordered and paid for forty-two gallons of fuel at 1s. 2d. per gallon with addition of 7s. 6d. for the cask. I have not yet received the fuel, although I have made applications for it. Five months is rather a long time to wait for delivery, and I certainly think that I should be entitled to my supply before those now ordering. Possibly they wish me to wait until paraffin is down again to 8d. per gallon! E.J.L.

Sir,—On July 30th I sent a cheque to Messrs. Binks ordering a carburetter and a barrel of fuel. I received the carburetter about three weeks after. The fuel, however, I have not yet received. This is now, at the time of writing, seven weeks within about two days. I have written several times, and have received about four letters or postcards saying that they are urging the railway company to deliver, and that I shall receive it in a few days. I had the same advice a month ago. I have made enquiries at the railway depots, and am informed that there is no delay in delivery. I do not know if any of your readers have had a similar experience. I for one shall certainly not order again. I have written asking for proof that it has been despatched and by what railway, but get no reply. I have now asked for the delivery of the fuel or the return of my money, failing which I shall have seriously to consider the question of recovery by other means. Mr. Binks is at liberty to keep mine and sell it at his advanced price. C.A.E.

#### The Boycott of German Goods.

Sir,—"Britisher's" suggestion for a league of motor cyclists pledged not to use "new" goods of German origin is an excellent idea, and, apart from being another blow to the enemy in the commercial world, is an important step towards building up the motor cycling industry in the British Isles *après la guerre*. My name is going in to "Britisher" without a moment's delay, and I await future copies of the "blue-covered book" to see how the movement progresses. When one is separated from the incomparable hobby for just on a year, it seems essential that somebody should be blamed for it, and pretty forcibly too, and I, for one, will see that no German article of

any description whatever is used by me in connection with motor cycling or anything else. *The Motor Cycle* is sent to me regularly every week, and so far not a copy has gone astray. I am particularly interested in the descriptions and illustrations of devices tending towards economy in fuel, and also appertaining to the satisfactory use of the substitutes now being produced. Needless to say, numerous cuttings are finding their way into my notecase, but as different engines are not always suited by the same fuel I should welcome any correspondence in your columns from riders of Douglas solo machines showing the results of their experiments with fuel and carburetter. Before leaving England I found my machine would run quite well on a 50% mixture of petrol-paraffin, but paraffin can be improved upon, and I would like to know which of the new fuels produces the most efficiency in the Douglas with Amac carburetter.

There are many like myself who desire to know what arrangement exists for supplying a limited quantity of petrol to soldiers home on leave from the Front, as the regulation cards are only valid for residents in the British Isles, and the man who can do with a week at his favourite pastime is left wondering what he is to run his machine on.

France

(GUNNER) J. CHESHIRE.

#### The Public Schools M.C.C.

Sir,—With reference to Mr. A. Q. Roberts's letter in your issue of July 6th, I beg strongly to confirm all that this gentleman states concerning the Public Schools Motor Cycle Club. How on earth can a club of this name be formed at the present time, when almost every fit old public school man is doing his bit in this war? Is it not absurd? If the formation of this new club is being granted permission by the committee of the original club it is a different matter altogether. Personally, I do not think this is the case.

Surely the older and more experienced motor cyclists, especially those in the habit of attending race meetings and hill-climbs, have not quite forgotten the smart little red flag with a hand-painted motor wheel, on which was clearly inscribed "The Public School Motor Cycle Club," Marlborough. D. CHURCHILL WEIR.

Bombay.

[The idea Mr. Roberts refers to was one to found a club for boys at present members of public schools. The P.S.M.C.C. is for both past and present members of the public schools, Universities, Osborne, Sandhurst, Woolwich, etc.—Ed.]

[Owing to lack of space we are obliged to hold over many letters of interest. They will be published as circumstances permit.—Ed.]

A Swansea vendor of *The Motor Cycle*, among other papers, and his 6 h.p. A.J.S. sidecarrier. Quite the most novel feature of this outfit, which belongs to Mr. Charles Evans, is the fine Dalmatian and his special platform. The advantages of sidecarriers for newspaper delivery are manifold.

By Post 1/10.

Obtainable from THE PUBLISHERS, ILIFFE & SONS LTD.,  
20, Tudor St., London, E.C. and all leading booksellers.

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

### Gradient.

**?** I have had an argument with a friend who states that a gradient of 1 in 1 would be vertical, which I contend is wrong. Would you please oblige by stating whether or not a gradient of 1 in 1 would be vertical.—R.B.

For road surveying purposes a gradient of 1 in 1 is not vertical. It means that in one unit of horizontal distance the ground rises an equal distance. The resulting gradient would be extremely steep, the line being at an angle of 45° to the horizontal line. Perpendicular would be 1 in 0. In railroad engineering, we believe, 1 in 1 is recognised as perpendicular.

### Carburettor Flooding.

**?** I have had great trouble with my carburettor leaking after it has been flooded, and, being a novice, I would like some advice about it. I only run about 60 m.p.g. of fuel with my two-stroke. Do you think the jet is too large?—W.F.

Petrol will always flow from the carburettor after the needle valve has been lifted. If, however, it drips if left standing, take the needle between the finger and thumb and turn it round, pressing it down on its seating. Probably there is a little grit there. If this does not cure the trouble you must grind in the needle valve with a little oil and crocus powder. The high consumption might be quite well due to the leakage at the float chamber. This does not mean that the jet is too large. There might, however, be no harm in your trying a smaller one.

### Difficult Starting.

**?** My machine is a 5-6 h.p. Rudge, overhead valve, and is a little difficult to start. Is there any way to prime the cylinder, as there is no compression tap?—G.H.L.

To obtain easy starting, you should make sure all the following adjustments are in order: Contact breaker points clean with a gap of .4 mm., see that the rocker arm is not sticking, make sure the carbon brush is clean, clean the carburettor, make sure no air leaks exist in the induction pipe, that both valves are in good order with fairly good springs, and the tappets adjusted properly. When the engine is cold allow about .5 mm. clearance between the exhaust valve and tappet, and just clearance between the inlet rocker and valve. In the absence of a compression tap all you can do is to prime the engine *via* the sparking plug hole by removing the plug.

### Taxes for Three-wheelers.

**?** I bought a Morgan runabout this year and paid £1 registration and £1 for licence (in March last). I am now asked by the police to pay another £2 3s., making my licence £3 3s. in all. As this machine comes under motor cycles and tricycles, I thought I was quite right in only paying £1, and shall be glad if you can tell me if I shall have to pay the extra.—F.P.B.

If the machine weighs over 3 cwt. you have to pay £1 for registration, but the car only having three wheels is still a motor cycle so far as local taxation licence regulations are concerned, and you are therefore only liable to a local taxation licence of £1.

### Hints on Driving.

**?** I have a 3½ h.p. three-speed motor cycle, and I shall be glad if you will give me a few instructions as to the correct use of the gears. I find in my district the second gear with full throttle is as fast as I want to go. Is it better to use this or the top gear with half throttle, which would give about the same rate of speed? (1.) Which is better for the engine? (2.) Which way will use the least petrol? (3.) What is the correct way to use the air inlet? I close it to start the engine, and then open it wide, leaving it in this position until I want to start the engine again.—R.J.T.

(1.) It would be better for the engine, and (2.) it would be better for the sake of economy to drive on the top gear as much as possible, controlling the speed of the engine by the throttle. (3.) Close the air only to start, and open it when the engine is once going, only closing it if the engine misses fire through too weak a mixture or is inclined to knock on hills.

### Connecting Rod Touching Flywheels.

**?** Could you advise me on the following questions: I have a 2½ h.p. machine, and I am troubled with the connecting rod rubbing on the flywheels. It causes my machine to knock now and again, and also causes a rattle all the time I am running. (1.) Should the connecting rod touch both sides of the flywheel or should it not? There is no up and down play on any of the bearings, as I have had them all renewed. I was thinking of putting a liner on each side of the big end, but do not know if this will be good practice. (2.) Is this a common form of trouble? My last machine had all the bearings worn when I dismantled it, but I was never troubled with the connecting rod rubbing. (3.) Do you think I should put liners at each side of the big end, or have a special bush turned ⅛ in. longer than the standard, so that I could have ⅓ in. overlap at each side and thus prevent the connecting rod from touching the flywheels?—J.T.

(1.) The connecting rod should not touch the sides of the flywheels. Perhaps a thin washer on each side of the big end bearings will prevent this trouble. It is more annoying than serious. The only thing that really matters is vertical play. (2.) The trouble is not a common one. (3.) We should say that it would be hardly necessary to have a special bush turned, but, of course, this would be a rather more practical way of carrying out the alteration, though it would not be the cheapest way of getting over the difficulty.

### IMPORTANT NOTICE.

#### GOODS MADE IN GERMANY.

The proprietors of this journal, being fully in accord with the recommendations agreed upon at the Paris Economic Conference, give notice that they will not permit the advertisements of new goods manufactured in enemy countries to appear in this publication, either during or after the war.

ILIFFE & SONS LTD.

### Too Much Air.

**?** I have a 3½ h.p. horizontal twin with racing cams, which give a slight overlap in the valve setting. This machine is not very good at easy starting. I have seen to all the usual adjustments, i.e., air leaks, plug points, magneto. To start, I fully advance the spark and give full air and half throttle (this is usual, I think); carburettor, Amac with 32 jet. Would a 34 jet be abnormal for this type of engine? I may say the present petrol consumption is quite low. I have to flood the carburettor rather a lot to start.—V.L.A.

We should think your difficulty in starting is due to too much air, as you say you have the air lever open for starting. This is not correct; you should fully close the air, and give about one-quarter throttle. What is wanted is a small quantity of very rich mixture for easy starting. Your jet should be about correct, though you might try a slightly larger one. When running on full throttle you should find that by slightly closing the air an improvement in running is effected, if the correct sized jet is fitted. At all other speeds except starting, you should be able to give full air.

**Timing.**

**Q** I recently bought a 1912 4 h.p. motor cycle and sidecar, and wrote the makers with regard to timing and size of jet (B. and B. carburetter). They sent me the following instructions: Valve timing. Exhaust to close at the top of the stroke, and inlet to open immediately after. Magneto timing. Platinum points to break with lever fully advanced when the piston is at the top of the stroke. I thought there must be a mistake on this point, and wrote the makers again, and they still insist on this timing for the magneto. They also recommend a 40 jet to the B. and B. carburetter. It seems to me that with these settings there will be great overheating and heavy consumption. (1.) Of course, the valve timing is normal, but I cannot understand the magneto timing. Would you be good enough to give me your advice on the matter? (2.) What do you think is the reason for this timing? I cannot get a sensible answer from the makers—simply a dogmatic assertion that "this timing is best for a 4 h.p. machine." (3.) I have a 1915 Amac carburetter, and think of fitting this. What size jet do you think would be about right with medium weight sidecar and 10 stone passenger?—W.G.F.

(1.) We should say that the magneto timing given is decidedly on the retarded side. We would advise you to try timing it as follows: Piston top dead centre, ignition retarded, contact points just separating. If this setting should cause knocking when fully advanced the setting should be gradually retarded a bit at a time until the full advance can be taken without knocking being caused. We should say you could not better the valve timing. (2.) We fancy the makers must mean "retarded," not "advanced."

(3.) No. 40 jet seems very large. We would have thought 30 to 32 plenty large enough. The only way to arrive at the correct jet size is by experiment. First try fitting a jet which is too small to run the engine properly, then gradually increase the size until you have such a size that up to half throttle you require rather more air than throttle, but after half-throttle opening rather less air than throttle to get the best results. This applies to the old pattern B. and B. In the modern semi-automatic type of carburetter, such as the needle valve B. and B., Amac, Senspray, etc., you should be able to give full air at all speeds, after a start has been made, except perhaps at very slow speeds; also at full throttle opening, when the machine is pulling hard, closing the air levers slightly should be found to make an improvement in running if the correct sized jet is fitted.

**The Petrol System on a Four-stroke.**

**Q** Would you kindly state whether the petrol system of lubrication can be used on a low-powered four-stroke engine with the same success as on a two-stroke? My own machine, on which I am thinking of using this method, is a 2½ h.p. single-cylinder with overhead inlet valve.—S.A.

No; this type of lubrication cannot be used by itself on a four-stroke engine, as with this type of engine the charge is drawn into the cylinder only, whereas in a two-stroke the charge enters the crank case as well as the cylinder, so lubricating all parts. The petrol system can, however, be used in addition to the ordinary pump feed system, and, if the piston is inclined to be a tight fit, is very desirable, as it ensures a liberal supply of oil reaching the piston and rings.

**Misfiring on a Twin.**

**Q** I am having some trouble with a 1915 2½ h.p. twin. It is extremely difficult to start, but after starting and getting it warmed up it will run fairly well for some distance when it starts missing badly, and will stop altogether on a slight hill. I then examine the plugs—both new Lodges—the jet, and clean out the carburetter, making sure there is not a spot of dirt or water about. A start after about fifty yards sprint will still have it missing. All the inlet unions are bound with tape. The spark seems regular, but not too strong. The only thing I have not done is to fit new inlet valve guides. They do not seem to be detachable. The valves seem rather a loose fit in the guides. Can you give me any advice as to how I can effect an improvement?—W.M.

We do not think your trouble is due to worn valve guides. It is probably due to some detail in the magneto. Have you made sure that the contact breaker rocker arm is quite free and not sticking? See that the points make good contact, and are clean. Also clean the carbon brushes, and see that the high-tension wires are not damaged in any way. Also pay attention to the valve springs, these being weak might cause missing. Possibly (but unlikely) the magnets require remagnetising. We presume you have cleaned out the petrol feed pipe.

**EXPERIENCES WANTED.**

Readers desirous of obtaining the experience of others with various motor cycles or accessories must enclose a stamped addressed envelope in which the replies may be forwarded. Answers to the queries should be addressed c/o The Editor.

"J.P." (Lincoln).—3½ h.p. Scott running with a petrol and paraffin mixture.

"J.B." (Cleator Moor).—Advice on upkeep of Hendee Special motor dynamo, also Alkum accumulators in connection with same outfit.

**RECOMMENDED ROUTES.**

**NORTHAMPTON TO WIMBLEDON.**—H.W.A.

Northampton, Newport Pagnell, Woburn, Dunstable, St. Albans, Aldenham, Bushey Heath, Harrow Station, Alperton Green, Ealing, Kew, Richmond, Wimbledon.

**HITCHIN TO TETBURY.**—C.McD.

Hitchin, Luton, Dunstable, Tring, Aylesbury, Thame, Wheatley, Oxford, Faringdon, Highworth, Cricklade, Malmesbury, Tetbury.

**PULBOROUGH TO LIMPFIELD.**—G.S.O.

Pulborough, Billingshurst, Horsham, Crawley, Copthorne Common, New Chapel, Lingfield, Crowhurst, Oxted, Limpsfield. Distance approximately 4½ miles.

**PLUMSTEAD TO SOUTHSEA.**—C.H.

Plumstead, Woolwich, Eltham, Mottingham, Chislehurst, Bickley, Addington, Purley, Redhill, Reigate, Dorking, Guildford, Hindhead, Petersfield, Cosham, Portsmouth, Southsea.

Miss Isabell Wells, of Bristol, and her 3½ h.p. lady's model Brough. Miss Wells is quite a novice, but finds the horizontal Brough particularly suitable as a lady's mount, on account of its ease of starting and control. Its flexibility is also a point emphasised by this West Country motor cyclist.

## The *Canoelet* STANDS ALONE

—In splendid isolation the "Canoelet" Sidecar remains the perfect example of the engineers' skill and the body-builders' craft. Synonymous with comfort, "Canoelet" means all-round sidecar satisfaction, especially for the lady who has been used to riding in a car. She will appreciate the luxury of the "Canoelet."

MEAD & DEAKIN, Tyseley, BIRMINGHAM.

## Simms non-soot Plug increases engine power.

The fat and fiery spark obtained with Simms "non-soot" Plug ensures instantaneous combustion of the whole of the charge, so if your engine does not develop its full power fit Simms "non-soot" Plug.

This British-made Plug fires at all engine speeds.

The rates for paragraph advertisements in *The Motor Cycle* are: First 12 words or less 1/6, and 3d. for every additional two words. Each paragraph is charged separately and name and address must be counted. Advertisements should be posted to arrive not later than by first post on FRIDAY morning for the following Thursday's issue. Address *The Motor Cycle*, Coventry, or 20, Tudor Street, London, E.C.

During the war *The Motor Cycle* has enhanced its already high reputation as THE newspaper for motor cyclists. It is read by practically every owner (and intending buyer), whether in the army, navy, air service, or civil life, and is, therefore, the most suitable medium for readers' advertisements of second-hand goods — for sale, wanted, or to be exchanged.

## Callers on day of publication.

In respect to my advert. in *The Motor Cycle*, on arriving home on Thursday afternoon I found a gentleman had been waiting two hours to see my machine. Since then I have had 10 APPLICATIONS, and my wife informs me that as early as eleven o'clock on Thursday morning a man came to see the machine.

C. HECTOR PETERS,

13, Mayow Rd., Forest Hill, S.E.

## An excellent advertising medium.

I must give *The Motor Cycle* credit for being an excellent advertising medium. Your paper must have been newly published when QUITE A HOST OF OFFERS came for my carburetter, and also offers to supply tank I asked for.

JAMES PAUL,

124, High St., Perth.

## Sold same day.

I wish to thank you for inserting the last advert. I sent in place of the one that was too late.

It may interest you to know that the machine was SOLD THE SAME DAY that the advert. appeared. I also had MANY WIRES AND LETTERS.

Undoubtedly *The Motor Cycle* is THE paper for motor cyclists in every way.

J. L. RUTTER,

Newlands Park, Sydenham.

## Delighted with speedy replies.

I am delighted with speedy replies received through the medium of your valuable paper, *The Motor Cycle*. Last week, advertising exchange, I have HAD REPLIES EVERY POST, and have suitably exchanged with a satisfied reader.

G. HARROP,

57, Abbeyhill Rd., Oldham.

# MISCELLANEOUS ADVERTISEMENTS.

## PRICES.

**ADVERTISEMENTS** in these columns—First 12 words or less 1/6, and 3d. for every two words after. Each paragraph is charged separately. Name and address must be counted. Series discounts and special terms to regular trade advertisers will be quoted on application. Postal Orders sent in payment for advertisements should be made payable to **ILIFFE & SONS Ltd.,** and crossed **& Co.**

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle" Coventry, or London (20, Tudor St., E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

## NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charge. Only the number will appear in the advertisement. All replies should be addressed, "No. 000, c/o 'The Motor Cycle,' 20, Tudor Street, E.C."

## DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged, when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

## SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

## MOTOR CYCLES FOR SALE.

## Radco.

RADCO, 1915, 2-speed, 2-stroke, exceptionally good condition, and complete with accessories; £24/—Colmore Depot, 31, Colmore Row, Birmingham. [X781]

RADCO, 1914, 2-stroke, 2 speeds countershaft, 17 tyres, piston and rings, footboards, enamel plating as new; nearest £19.—A. J. Jarvis, Watnall Cirencester. [12]

## Regal.

REGAL, 1915, 2 stroke, 2-speed, open frame; 2 with accessories.—Colmore Depot, 31, Colmore Row, Birmingham. [X78]

REGAL-GREEN-PRECISION, 1914, and coachbuilt sidecar, very little used; £39; like new.—Nicholls St., West Bromwich. [X78]

## Rex.

REX, sidecar, Mabon free engine, accumulator; £67/—34, Stanbury Rd., Peckham, London. [14]

1910 Rex Motor Cycle, less power unit; £3.—Bouley, 248, Haughton Green, Denton, Manchester. [X78]

REX 5-6 h.p. 2-speed Combination, complete, ban starter, just overhauled, wicker sidecar; £30/171, Burges Rd., East Ham. [2]

REX 5-6 h.p. twin, T.T. clutch model, tyres a belt new, machine in splendid condition; £21/14, Dodbrooke Rd., West Norwood. [22]

REX 1912 6 h.p. Combination, 2 speeds, free engine handle starting, lamps, horn; splendid bargain; £30.—3, The Mews, Victoria Rd., Olapham, S.W. [2]

1913 Rex 5-6 h.p. Twin, 3-speed, with coachbuilt car, tyres perfect, just been overhauled; £1 allowed sacrifice £20, or offer.—Campaigne, 17, Halsey Rise, N. [14]

REX, 6 h.p., 2-speed, wicker sidecar, Hinks, White petrol, oil gauges, binged stoppers, all tyres excellent, lamps, horn, spares; £23.—Evenings, Quintin Av., Wimbledon. [21]

FIRST P.O.O. Secures this bargain.—1911 6 h.p. T Rex, free engine model, new Dunlop tyre on be in good running order; £10; Bosch mag.—Wallis, High St., Saffron Walden, Essex. [X78]

1914 Rex 6 h.p. Twin, 3-speed combination, with seat sidecar, complete with accessories, in B rate order; £45.—Tuke and Bell, Ltd., Motor Dept, Carlton Engineering Works, High Rd., Tottenham. [59]

## Rex-Jap.

6 h.p. Rex-Jap and coachbuilt sidecar; £27/10—Wauchope's, 9, Shoe Lane, London. [26]

## Rover.

ROVER, 1916, new, 3½ h.p., 3-speed countershaft combination, actually in stock.—Moss, Wem. [X78]

1914 (new 1915) 3½ h.p. 3-speed Rover, practically as new, very fast; £37.—Waverley Hotel, Walsley. [21]

ROVER, 3½ h.p., clutch model, sound, but not mine; £22, or your reasonable offer.—Laytons' Garage, Bicester, Oxon. [X78]

ROVER Combination, fully equipped, late 1915, speed countershaft, new condition; 60 gns.—Willes Rd., Leamington. [X78]

1913 3-speed Geared and Clutch Model Rover, thoroughly overhauled and complete; 30 gns.—Colmore Depot, 31, Colmore Row, Birmingham. [X78]

1912 Rover, 3½ h.p., free engine, B. and B. c. breitter, Bosch mag., excellent condition, w good tyres and engine; £20.—Robinson's Garage, Gr St., Cambridge. [21]

ROVER, 1913, T.T., with accessories, very fine machine; usual price £32/10, special sale price £29/10, cash only.—Lamb's, 151, High St., Walthamstow, and 50, High Rd., Wood Green. [26]

BIRMINGHAM Agent, P. J. Evans, 87-91, J. Bright St., has all Rover models in stock for immediate delivery; countershaft T.T. with fixed or also semi T.T. model, with h.b.c. Philipson; prices £52. [X78]

ROVER, 1913, 3½ h.p., free engine, Philipson h.b. semi-automatic B. and B., Hutchinsons, Glor phone, tools, and spares, condition, plating, enamel perfect, 38 gallons Hinks and petrol; £30.—W. Waverley Rd., Kenilworth. [X78]

ROVER, specially selected, very fast, 3½ h.p. T. with Philipson pulley, Cowey speedometer, F.E. lamp, Lucas horn, extra large tank, all in excellent order, tools, and spare parts complete; price £37, close offer.—Box L2165, c/o The Motor Cycle. [23]

## Royal Ruby.

ROYAL Ruby, 2-speed, 2-stroke, 2½ h.p., bar soiled; £27/10.—Colmore Depot, 31, Colmore B. Birmingham. [X78]

## Rudge.

RUDGE Multi, late 1914, practically as new, fully equipped, speedometer; £35.—Below. [22]

RUDGE Multi, 1913, in real good order and condition; £27.—6, Warren St., London. [22]

RUDGE Multi, 1915, 3½ h.p., splendid condition, many spares; £43.—348, City Rd., E.C. [24]

1912 3½ h.p. Rudge, free engine, good condition; £—R. E. Jones (Garages), Ltd., Swansea. [10]

## Single v. Twin.

**O**F the many problems which have confronted the motor cycle manufacturer in the past, none has been resuscitated so many times as that of single v. twin-cylinder engine. In the one camp we have manufacturers whose outstanding motto is "Reliability," and in the other camp there are manufacturers whose motto is "Pleasurable riding coupled with reliability." We are tempted to revive the subject once again by reason of the views of "Road Rider" expressed in an article in the current issue. This writer is a man of exceptional experience of many and various makes of machines, and he is an exceedingly competent observer. As a result of his unequalled experience "Road Rider" has not the least hesitation in saying that after the war there will be a great and rapidly culminating prejudice against the single-cylinder engine, and that ere long it will become extinct.

Whilst giving voice to "Road Rider's" considered judgment, we must say that we are not so convinced of the speedy demise of the single-cylinder machine as our contributor. "Road Rider" bases most of his views upon the fact that the single-cylinder machine is unnecessarily uncomfortable, and that people are already tired of it and want something which provides smoother running. We contend that reliability will always be the predominating point of attractiveness to the buyer, and perfect as the modern twin-cylinder mount has become, it is doubtful if it be yet the equal, from the point of view of reliability, of the single-cylinder machine. Thus for utility purposes the single-cylinder will always be able to claim its adherents. We will further confess that a multi-cylinder machine is far and away more attractive in its working than a single-cylinder machine, and if the same degree of reliability can be obtained no one would dream of changing from a twin to a single-cylinder. But where we again quarrel with "Road Rider's" sweeping assertion is from the manufacturing point of view. Granted that ease of

manufacture should be no valid reason why comparatively uncomfortable machines should be foisted upon the public, one must remember that manufacturers produce motor cycles from a business standpoint, and the fact that so many single-cylinder machines are produced is not necessarily because their makers consider they are better than the multi-cylinder machine, but on account of the fact that they are easier and cheaper to produce.

To sum up, the comments in this issue will undoubtedly point to an important tendency in design in favour of the multi-cylinder machine, but we are of opinion that "Road Rider" is moving much too quickly in suggesting that 500 c.c. single-cylinder machines will become obsolete in the near future.

## Our Over-zealous Police.

**A**MOST extraordinary case of police interference was brought to our notice during the past week. A motor cyclist was proceeding through Bruce Grove, Tottenham, at 11.45 a.m. one day, with his wife in the sidecar and his children on the carrier, when a policeman in uniform stopped him and told him that two plain-clothes officers wished to speak to him. In due course the plain-clothes men came up, and asked him if he were the owner of the machine and where he was going. Subsequently they wanted to know what he was using, and whether he was travelling on business or for pleasure. His licence having been inspected, he was allowed to proceed.

We immediately communicated the full facts of the case to the Metropolitan Police headquarters, and we are glad to say that the matter was promptly investigated. The facts as we related were found to be true—so we were later informed—and the error was due to a zealous officer. Anyway our correspondent need have no fear, the whole thing was a mistake, he will hear no more of the threatened summons, and other motorists are not likely to be molested.

# THROUGH FEMININE GOGGLES

## The Levis as a Lady's Mount

AT the present time it does not seem altogether good taste to sing the praises of solo machines, for, with so many disabled soldiers about who appreciate runs, one feels selfish spinning along in solitary fashion, however much one's journey may be for business purposes. Still, there are times when the petrol allowance precludes any idea of generosity, and the solo machine has to be used in order to get the greatest mileage possible. On such occasions it is certainly a fast-running economical little machine that is required, and a few weeks ago I found a  $2\frac{1}{2}$  h.p. Levis admirably suited for the purpose. Personally I prefer a passenger by my side to share with me the exhilaration of the ride, but there are times when a good running machine is itself as congenial a companion as it is possible to find. To skim up the hills and to glide down the other side takes one back to the old days of trials.

Such an experience I have had upon the mount I have just mentioned. It was one of the new sloping framed Levis machines, suitable for either sex, with

The  $2\frac{1}{2}$  h.p. two-speed Levis. Note the chain drive and low saddle position.

an exceptionally low saddle, which is always in favour with ladies. The engine is the well-tried  $2\frac{1}{2}$  h.p. two-stroke, produced in the works of Messrs. Butterfield Bros. The Enfield two-speed gear, in conjunction with all chain drive, is a feature. The Best and Lloyd oil pump gives a twin oil feed (cylinder and crank case).

There are one or two tricky little hills in my neighbourhood, calculated to try the inexperienced rider or the inadequately engined mount, but the Levis hardly seemed to recognise the hills as such.

I found that the simplest way of starting the Levis was to give it a push on bottom gear, then put gear handle into neutral position while I took my seat, gently bringing the gear handle into low to start away. It is always necessary to allow the engine to pick up speed before changing into top. It is the most lively little two-stroke engine that I remember, and capable of a remarkable turn of speed.

Two-strokes are becoming great favourites with ladies, some of whom are sufficiently daring to take a passenger on the carrier. No doubt the difficulty of obtaining petrol is the sole reason why there are not many more lady riders on the road; the two gallons allotted per month limits our mileage to such a great extent unless substitutes are used.

MAY WALKER.

Lady motor cyclists of the future.

### NEW AUSTRALIAN RECORDS.

SINCE our last issue went to press we have received the times of the new records made by Jack Booth and briefly mentioned on page 251. The new times and previous records are:

ONE MILE.				
Booth (Indian)	...	37 $\frac{3}{4}$ s.	Parsons (Am. Excelsior)	46 $\frac{2}{3}$ s.
FIVE MILES.				
Booth	...	3m. 25 $\frac{3}{4}$ s.	Parsons	...
				4m. 11 $\frac{2}{3}$ s.
TEN MILES.				
Booth	...	7m. 45 $\frac{4}{5}$ s.	Parsons	...
				8m. 28 $\frac{4}{5}$ s.

A10

According to a Melbourne contemporary just to hand the Victorian Motor Cycle Club has refused to recognise the times quoted for the mile and five miles. The reason appears to be that Booth made runs on two successive days breaking the one and five miles records the first attempt, and lowering all three at the second. The club will only grant certificates for the times made on the first day, though the club's timekeepers attended the second attempt.

### Miniature Engines on War Service.

It may be news to some of our readers that the Government is taking lots of small c.c. engines for war service. The latest 220 c.c. bantling of the A.B.C. family was, of course, early pressed into employment as a starting unit for bigger engines, alike on sea-planes and on other large power units which I must not particularise. And the wee two-stroke is not being overlooked either, whilst at least one 5-6 h.p. two-stroke twin is wearing khaki.

### Carry a Spare Brush.

When the magneto was first introduced I examined its mechanism scrupulously, and decided to carry a spare high-tension brush, as the wee carbon pencil seemed essentially vulnerable. For many a long year one of these spares reposed snugly in my purse, and in the early days of the magneto it came in handy more than once. After a time prolonged immunity ended my precautions, and, of course, I got nicely had on a small twin, when both high-tension brushes sheared simultaneously. I have heard of other cases, and therefore I advise my brethren to revive ancient habits, and carry spares.

### Multiple Jet Carburetters.

The more I ride, the more I become convinced that multiple jet carburetters make for petrol economy. In my garage there are seven separate types of carburetter at the present moment, two of which are three-jets. By careful tuning I can get much about the same power out of the septet, together with approximately equal acceleration and flexibility. But the three-jets score on two points very easily, one of these points being a mere fad, whilst the other is of vital importance. They certainly give a lower minimum of revolutions; if throttled down with the engine running free, the single jets give coarse running at the best, whereas the three-jets close down to a mere tick. This detail is of interest to sidecar men, but does not materially affect solo work. On the other hand, the three-jets readily give a superior petrol economy, averaging 25% better than the single jets, which implies an economy of 6d. or more on every 100 miles at the present cost of spirit, or about 30s. on a year's riding. The one and only comparative defect of the multiple jet types is that their fine orifices are far more liable to choke than the big hole of a single jet, and this weakness can be eradicated by fitting a sensible petrol filter.

### The New "Best" Lubricator.

I have never known a novel accessory excite so much interest as the "Best" pump. I thought my present mount had a pretty satisfactory lubricator. It has a small pump on the timing cover, which sucks oil from the tank, and drives it through a sight glass into the engine. The oil feed thus varies with engine speed, an idea which is commonly regarded as unsatisfactory, because most engines are often driven at very low

r.p.m. on high gears under widely different circumstances, e.g., ticking on a whiff of gas in traffic, and pounding on full throttle up a grade. Therefore, the usual ideal is that the perfect lubricator must distinguish not only between engine speeds, but also between engine loads, as the "Best" does. This criticism does not apply to my machine, for the simple reason that it is never allowed to pound slowly uphill on full throttle. The lowest of its four gears is  $13\frac{1}{2}$  to 1, and it develops over 12 b.h.p., so that it can "rev." up the steepest freak hill even with a sidecar attached; and whenever it is able to "rev." on a lowish gear the lubricator will feed plenty of oil. Still, most engines know what it is to be reduced to a slow pounding progress by dint of load and grade; and for such engines the "Best" lubricator should prove perfect. It is just one of those brilliant little notions which deserves to come into universal employment, and I do not see why its main features should not further serve to improve the lubrication of many car engines.

### Engine Rattle.

I made careful enquiries in Coventry the other day as to whether the expert two-stroke technicians had reached any unanimous decision on the subject of what common or garden two-stroke users familiarly term "engine rattle." There would still appear to be two leading schools on this point. The one holds that the metallic ring, tinkle, or rattle, not uncommon with dirty and well-worn engines, is due to the deflector of the piston, when coated with carbon and elevated at the top of the stroke by wear of the connecting rod bearings, which may just catch the under-side of the cylinder head; I must look for dints in the carbon on the ridge next time I dismount a two-stroke engine. The opposition ascribes it simply to the piston rings getting stuck in their grooves with carbon, and so catching against the edges of the ports, instead of sliding smoothly over them. There would appear (to an ignoramus, like myself at any rate) some unnecessary fog on the subject. If the former opinion is correct, it should be easy to demonstrate the fact of piston collision by careful measurements of the maximum clearance (if any) after allowing for oval bushes and carbon films; or, alternatively, to construct a testing engine, similar in every respect to the standard engine, except that there should be a slight depression in the cylinder head, parallel to and coextensive with the piston deflector, yet keeping the usual compression ratio. On the other hand, the question of the piston rings catching wants looking into. The noise hardly sounds as if it emanated from two piston rings catching on three separate ports; some information might be obtained from tests with one, two, and three rings, fitted in various combinations with one or more rings pegged down to the equivalent of being stuck with carbon. Do the piston rings of a Silent Knight engine ever make this or a similar noise against their ports?

## ITS PROSPECTS AFTER THE WAR.

By "Road Rider."

**M**ANY aspects of the motor cycle industry in days to come defy analysis and prophecy. Increased reliability and multi-speed gears are bound to render six day trials something of a farce. Nobody can determine how far taxation and protection or prohibition may affect prices. Nobody can say at what level fuel prices will eventually simmer down. But I am venturing to make one unqualified and dogmatic assertion, which is nevertheless highly controversial; and I make it in order to wake up the trade to a position which is largely unrealised. *I believe the 500 c.c. single-cylinder is doomed!* It is obvious that if this statement is but partially true, it places many British firms in rather a serious position. The 500 c.c. single-cylinder is the machine with which the British trade secured the supremacy of the world's motor cycle industry. Several of our leading factories are organised in peace time with a sole view to its production in enormous quantities. In the past their outputs have sold with consummate ease. For two years past our industry has been either stationary or non-existent, whichever way one prefers to phrase it. So far as one knows, there has been little time for engineers to form plans for the future. It is certain that very few designers have formed clear ideas of popular taste in the era succeeding the war. Should it therefore prove that an increasing percentage of the riders who lead opinion and demand have done for ever with the 500 c.c. single-cylinder, the British motor cycle industry will be largely unprepared for the profoundly changed conditions under which it will resume manufacture. If a deep and increasing prejudice is rife against what was formerly our most popular model, it is time that the trade realised this prejudice. It is time for the Government to release sufficient brains and energy in each factory for the preparation of a more modern type of machine.

### Why the 500 c.c. Single is Waning.

For some time past riders have been undergoing a slow education in the possibilities of comfortable motor cycling. While the 500 c.c. single was certainly the dominant type prior to the war, it was popular because it was established. The most ignorant rider knew the fame of its most distinguished makers, the power and reliability and speed of their machines, the honesty of their dealings. Nevertheless, it had already ceased to be the most attractive or the most interesting machine for riders who were better instructed or more fastidious than the general ruck. Others of us had tasted the comparative freedom from engine vibration afforded by such alternative designs as the Scott twin two-stroke, the Douglas horizontally-opposed twin-cylinder, the big British and American twins—which

do most of their work throttled hard down—the F.N. and Henderson four-cylinders, even the despised baby two-stroke with its even power impulses. Engine vibration has ceased to be a matter of any vital importance on these machines, and many of us, during brief returns to the thumping single-cylinder, realised what an increase of comfort the practical abolition of engine vibration had brought about. During the war, the big single-cylinders have been all but unobtainable. As a consequence a vastly increased section of the public has enjoyed a novel freedom from vibration by riding various smooth-running mounts. Sandwiched between such foretastes of the future, we have all had confirmation of the thumpiness of the big single in the form of brief spins on the type of machine which was once all but universal. Moreover, the big single suffers far more from engine vibration than its forebears did. Their impulses were softened by the flexible drive of the long belt; the modern single is further handicapped by the harshness of a two-chain or chain-cum-belt drive. It may be, probably is, the simplest and staunchest machine available for prolonged hard work, the best D.R. machine in the world; but it can never again figure as the ideal mount for pleasurable touring.

### The Elimination of Road Vibration.

There is a further factor to be considered—that of road vibration. Obviously, it is quite as easy to spring the frame of a 500 c.c. single as that of a 350 c.c. or 1,000 c.c. twin, and it might appear at first sight that road vibration was a factor applying equally to all types of engine. This is untrue. A few pioneer firms have lately introduced good rear sprung frames, for which there will be a perfect *furor* after the war. Their general effect on public opinion will be to raise the standard of comfort, and so to heighten the prejudice against engine vibration. Thus, though their influence on the matter of engine vibration is indirect, it is very real.

To put the matter more briefly and simply, I do not personally intend to ride another 500 c.c. single-cylinder machine of the current type. I have tested all the patterns now on the market, and, without haste or partiality, I have come to the conclusion that this particular type compares most unfavourably with more modern patterns. I believe trade will gradually desert the concerns which cling to this declining type. I believe the manufacturers of more refined and comfortable designs will rapidly learn to embody the reliable and substantial construction long characteristic of the typical British single; and that the future of the 500 c.c. single is limited to the light T.T. patterns employed as sporting mounts.

## THE CROWN LOCKING CAP.

FROM time to time we have published various methods of securing nuts. There is the castellated nut and split pin, which is expensive and troublesome to remove; there is the spring washer, which places an unequal strain upon the nut and bolt and a strain on the thread in getting the spring washer flattened out; and various other types of locking devices.

The Crown Locking Cap Co., 1, Bank Chambers, Bromsgrove Street, Birmingham, have, however, introduced an ingenious device, which consists of a cap provided with a central beam fitting into a slot which should be first cut in the bolt. It is pointed out that it is just as easy to cut a slot in the bolt as it is to drill a hole for a split pin. At right angles to the central beam which engages the slot are two tongues, the object of which is to catch in the thread. When the nut has been screwed up to the right degree the cap is slipped over so that the central

The Crown locking cap.

beam engages with the slot. The two tongues then ratchet themselves over the thread in which the cap has been pressed home, preventing the cap from sliding up the bolt. To remove the locking cap it is only necessary to slip back the tongues by the aid of a screwdriver or some similar instrument.

The Crown locking cap can only be employed in cases where the bolt projects sufficiently far beyond the end of the nut to allow the cap to be fitted. The manufacturers supply a special slotting saw for cutting the slot in the bolt.

## THE TAN-SAD SPRING CARRIER.

EVEN though one is not addicted to mounting a passenger on the carrier, there is nothing more useful in these days, when it is so often necessary to carry a full petrol tin, than something in the way of a spring platform on which to mount it. When mounted on a rigid carrier a petrol tin soon becomes battered, and if it springs a leak its whole contents may be wasted ere the rider discovers the mishap, while the dead weight of such a load is apt, in time, to fracture the carrier stays. Luggage of any kind rides much more comfortably and securely if mounted in a sprung position than if subjected to the tremendous jolting and jarring which ordinarily befalls it aboard a motor cycle.

The Tan-Sad, which is designed chiefly for mounting a passenger, is fixed simply by the use of a small key, clipped under the cushion, and can be placed in position and securely tightened in a very few seconds.

The springing of the seat can be varied to meet one's requirements by the number

of springs employed. Though provision is made for four springs, two are quite sufficient for ordinary loads. The fittings provide a remarkably comfortable seat for the pillion passenger, and it appears to be a thoroughly well-made and well-designed article.

The seat is perhaps a shade far back, and we would suggest that if the pivot joints were brought further forward and the seat also lengthened in the direction of the rider, balance and the comfort of the passenger would be improved. It would also be an excellent plan if the makers so arranged the fitting that the tool-bags, having been removed from the rigid carrier, could be attached to the sides of the spring seat, as this would save the contents of the tool-bags and the bags themselves very considerably.

This attachment, which is far from being unsightly, is made at the Tan-Sad Works, 5a, Parker Street, Edgbaston, Birmingham.

## ACROSS AMERICA BY MOTOR CYCLE.

IN our issue of July 27th we mentioned that two New York lady motor cyclists, Miss Adeline and Miss Augusta Van Buren, were attempting the journey from New York City to San Francisco, on the Pacific coast, a distance of 3,300 miles, mounted on Powerplus Indians. On September 14th we were able to give a short account of how they climbed a famous American test hill, known as Pikes Peak, near Colorado Springs.

Our readers will no doubt be interested to learn that the adventurous

Tan-Sad spring carrier is here shown mounted on two springs only; for carrying heavier loads more springs can be used.

young ladies reached San Francisco on September 2nd, having been two months, less two days, on the journey. They encountered many difficulties, such as land-slides, desert wastes, and broken down bridges. The weather conditions were especially adverse, but, in spite of all these and the atrocious road surfaces encountered in many parts, especially, of course, during their journey across the American desert in Western Utah, their Indians brought them through in splendid style.

When one considers the distance, the absence of roads, and the hundred and one difficulties encountered on such an undertaking, which have on previous occasions proved the undoing of many hardened riders, the performance of these young ladies is really marvellous.

After completing such a strenuous journey, it is not surprising to find that the riders as well as their machines should not look so spick-and-span as at the commencement.

The Misses Van Buren at the summit of Pikes Peak in the course of their 3,300 miles' journey from Atlantic to Pacific. They left New York on July 4th and reached San Francisco on September 2nd. The ascent of Pikes Peak entails a climb of 2½ miles to 14,109 feet above sea level. In the photograph the Indians have the mudstained appearance of many days' severe grueling.

## ROAD TEST OF WITAL MOTOR FUEL.

**A Fuel which has High Capabilities in the Matter of Speed.**

**T**HE machine on which the following tests were made is a 1916 3 h.p. Enfield. It has been specially fitted for the use of heavy fuels, the Amac carburetter having been provided with an efficient hot air intake, while the induction pipe has been lagged to prevent radiation. Almost as important, minute care has been taken in guarding against air leaks, it being impossible to obtain good results from a heavy fuel unless this point be carefully watched. Insulation tape, seccotine, and indifference as to the look of things are, to a certain point, common necessities in these days of heavy petrol and still heavier substitutes.

With high expectations the tank was filled up with Wital fuel and the engine started. It obstinately refused to fire in one cylinder, this being the front cylinder from which the hot air supply is drawn, and consequently carburation did not improve as the engine warmed up. This kind of thing had happened before when experimenting with heavy fuels, and we knew that, in order to give the Wital sample a fair test, the engine must be taken down and decarbonised—quite a brief task with the Enfield engine. While at it we also took the opportunity of reducing the compression by inserting a  $\frac{1}{32}$  in. packing between each of the cylinders and the crank case, and we can now say with confidence that this has much improved the running of the machine.

A note here which may be of interest to the owners of small twins reduced to the consumption of heavy fuels (no joke intended). Many of these engines will not run satisfactorily on heavy fuels unless reasonably free from carbon deposit. The deposit soon increases the compression to an extent which causes pre-ignition, and the trouble is aggravated by the deposit forming more and more rapidly as bad running continues.

The task of decarbonisation can be made much less frequent by reducing the compression, and now that winter is drawing near this can be done with advantage.

### **A One-third Petrol Mixture.**

The engine now started up with the healthy beat of a 9 h.p. twin, and it was decided first to try a mixture of one-third petrol and two-thirds Wital. The tests were made over a tortuous mountain route, a thirty-mile circular tour being chosen. Several really bad gradients and freak corners were encountered, one of the climbs being  $3\frac{1}{2}$  miles in length—a steady upward grind, finishing up with fifty yards of 1 in 5 by way of a temperature indicator.

The engine was started up third kick by the assistance of the auxiliary petrol jet, the petrol being cut off instantly the engine had fired, and throughout the journey it ran with perfect sweetness with a plentiful circulation of oil. Slightly less power on hills was experienced than when pure petrol was used, the speed of the engine becoming subdued early in the ascent, and unless a change down was made in good time a distinct, though not particularly malicious, "pink" ensued.

With the Wital fuel mixture we found it particularly necessary to keep up the "revs," and by doing this it was possible to make very fast ascents. It was

not, however, possible to climb so slowly—and surely as with petrol.

The engine has always possessed rather unusual "revving" capabilities, but with the Wital fuel it surpassed itself. It is quite the fastest fuel the writer happens to have stumbled across, and on the few long level stretches the route included it proved very considerably faster than petrol. The first test worked out at 82 m.p.g., 28½ m.p.h.

Refilling the tank of the 3 h.p. Enfield after completing one of the tests.

### Road Test of Wital Fuel.—

A real upland hurricane was blowing, and in order to obtain fair comparative results it was necessary to make the second test that same day. The tank was now filled with neat Wital fuel, but, in spite of the auxiliary petrol jet, a good deal of difficulty was experienced in starting.

### Wital Fuel, no Petrol.

Much that has been said concerning the previous mixture still applies, though the engine proved rather more difficult to handle than when the one-third petrol was included. It took more air, however, and "revved" with just as much enthusiasm, though it proved extremely easy to muddle the mixture, with the result that "pinking" was very apt to occur at freak corners. The chief difficulty lay in the fact that on shutting off the mixture at a sharp corner the engine did not respond instantly on reopening the throttle. It merely jogged over compression for a few paces,

losing speed, and thus a "pink" ensued when finally it decided to fire. This could doubtless be put right by careful adjustment, but many riders have neither time nor aptitude for this.

There was no sign of overheating on hills, most of the long ascent being accomplished on the 35 m.p.h. mark, and by what may almost be regarded as a coincidence, the second round was accomplished within five seconds of the time taken on the first round. We append a table giving at a glance the comparative results:

Fuel.	m.p.g.	m.p.h.	Distance.
$\frac{1}{3}$ petrol, $\frac{2}{3}$ Wital	... 82	28 $\frac{1}{2}$	29.7 miles
All Wital	... 83	28 $\frac{1}{2}$	29.7 miles

Summing up, the Wital fuel would appear to be an excellent petrol substitute, and no motor cyclist need hesitate in sampling it. It is, of course, improved by the addition of petrol as regards starting, and we find that it gives far better results in warm weather than in cold.

## LIGHTWEIGHT SIDECARS.

CERTAIN individuals are pushing the lightweight sidecar, of which the motive portion is either a baby two-stroke or a four-stroke not exceeding 350 c.c. I have done one or two journeys in a 2 $\frac{3}{4}$  h.p. Douglas and sidecar, and must admit that the little jigger, especially in its three-speeded form, is a very plucky little puller indeed, though personally I value my Douglas too much to run it at such a high average of r.p.m., or to risk its light frame under such stresses. I cannot think there is any real economy in overworking a miniature engine or over-straining a featherweight frame. When the same craze is applied to the baby two-stroke it represents sheer lunacy, so far as the bulk of existing machines are concerned, and I am heartily at one with a well-known firm of lightweight makers who include in their vendor guarantee a fair usage clause, which excepts machines fitted with sidecars. The baby two-stroke engine might conceivably stand the racket moderately well in the flatter eastern counties, particularly when the roads are dry and the weather

windless. But it takes most baby two-strokes all their time to keep cool in hilly country with a single load and without the wind resistance of a sidecar, and no sane man would dream of burdening them with such a load in severely undulating localities. If any determined economist insists on running the risks he should use a 2 $\frac{3}{4}$  h.p. motor cycle, with very strong frame, such as the Colonial model Douglas. Many of the lighter and cheaper two-stroke frames would not last half a season under such maltreatment, and it is unfair on the best of them. When the leading constructors of high-powered heavyweights have experienced some difficulty in evolving sidecar chassis which will stand a season's hard work without fracture, it is folly to overweight light frames. IXION.

### DESPATCH RIDERS IN MESOPOTAMIA.

Thanks to the courtesy of Cpl. A. J. Sproston we are able to reproduce these interesting pictures. Sproston, it may be recalled, wrote a vivid account of his experiences in Mesopotamia, which was published in *The Motor Cycle* of July 27th last. The upper picture was taken on a railway truck, showing men and their Douglasses en route to a base. The lower view shows a few despatch riders at the headquarters of the Tigris Corps.

## ELECTRIC LIGHTING FOR MOTOR CYCLES.

### How to Adapt Electric Lighting to Two-strokes and other Lightweights.

IN many issues of *The Motor Cycle* references have been made to the important question of electric lighting for the now popular two-stroke lightweight, and it is by no means improbable before long electricity will come into its own, as an illuminant, in the motor cycle world to the almost complete exclusion of acetylene, as has already happened with regard to motor cars.

With the advent of the highly efficient metal filament bulb and scientifically designed electric head lamp with silvered parabolic reflector, resulting in a considerable reduction in current consumption, electricity has lost practically all its failings, and the old problem of the disposition of the battery ceases to appear as an unsurmountable proposition.

#### Dynamo Dry Battery or Accumulator.

As is well known, there are at the present time three available sources of electricity suitable for the motor cyclist: (1) the engine-driven dynamo, preferably with a battery arranged as a floating device or stabiliser to ensure a steady light when the machine is in motion and a continuance of light when the vehicle comes to rest, (2) the dry battery, and (3) the accumulator used alone.

Of the three alternatives, the dynamo is at present suitable only for passenger outfits where suitable accommodation for the various electrical fittings is not limited, or for the heavyweight solo machine, in which case a little extra weight is unnoticeable and there are better opportunities for the mounting of the battery and dynamo without their presence proving a source of inconvenience.

But for the true lightweight machine it is at present unsuitable, and we are compelled to turn our attention to the remaining two methods.

Dry batteries are now perfectly satisfactory for solo work provided careful attention is paid to the selection of a reliable, guaranteed article and too much in the matter of light is not expected from them. They suffer from the disadvantages, in the writer's opinion, of having no very obvious means of indicating their condition other than by short-circuiting with an ammeter, are not rechargeable, and, owing to their adoption not being universal, it is not always possible to obtain a new battery on the spot if the old battery fails while on tour.

There are, of course, ways of diminishing these defects; it is wise to carry two sets of batteries on the machine and fit a two-way switch at some convenient point to allow of either battery being brought into use.

For all-round efficiency, however, the writer still holds to the celluloid type of accumulator.

In selecting a suitable accumulator for motor cycle use, two points must have careful consideration. (a.) It must be designed expressly for the purpose in order to withstand the road shocks to which it will be subjected, and the type which some makers list as a Colonial model is well worth the slight extra cost. (b.) It must have a capacity and discharge rate suitable for the work it will be called upon to do.

The celluloid accumulator possesses the advantages of light weight and freedom of inspection owing to the transparent case over the teak lead-lined type of cell, and further, if built up with separators of corrugated perforated celluloid between the plates the construction is practically solid, and vibration has little effect upon the life.

With regard to the all-important question of capacity, the principal difference between an ignition battery and one designed for lighting is that while the former is only called upon to deliver current for not more than one-third of the total time the engine is running, the latter is expected to maintain a continuous steady discharge during the whole time the lights are in use, and consequently the capacity of the lighting battery must be very much in excess of what would be considered sufficient for an ignition cell in use for the same number of hours. The general trade rule is to rate the continuous discharge capacity at one-half the ignition capacity, and thus a 20 ampère-hour ignition cell becomes only of 10 ampère-hour capacity when required for lighting.

There is also a further point on the amount of the discharge, or the number of ampères required on the continuous discharge to be investigated. Broadly speaking, this current should not exceed one-tenth of the capacity of the battery calculated on its continuous rating, so that for the example previously mentioned the maximum current taken from a 10 ampère hour cell will be 1 ampère.

#### Selecting the Bulbs.

Having arrived at this stage, the question of the size of bulb supplying the light becomes the next factor, and it will be necessary to balance the desirability of a good light against the necessity of eliminating unnecessary weight.

For ordinary town use and general country riding a 4 volt .75 ampère screw cap bulb giving about three candle-power will be found suitable for the head lamp, and a 4 volt .3 ampère bulb of similar type

### Electric Lighting for Motor Cycles.—

giving about one candle-power for the tail lamp. This latter fitment should be of the pattern which can be housed away under the carrier and protected from the tyre by the mudguard.

The total current taken by the two bulbs in use will be slightly in excess of 1 ampère, and, remembering the rule of one-tenth the capacity, we shall be well inside the limit by adopting a 15 ampère-hour 4 volt battery for the purpose. If the ignition type of cell only is available, after being satisfied that the construction is all that could be desired, see that the ignition capacity is given at not less than 30 ampère-hours. The maximum charging rate will probably be marked at from  $1\frac{1}{2}$  to 2 ampères, and at this rate the battery will be fully charged in ten to twelve hours.

### The Best Place for the Accumulator.

With regard to selecting a suitable position for the battery on the machine, the ideal place is about the centre of the frame, as this is the point at which the vibration will be least felt, but as this position is usually fairly congested by the time the motor maker has secured his various mechanical devices, the next best situation is aft of the seat-pillar tube, and in the majority of machines sufficient space will be found between this tube and the rear mudguard. Failing this position, the only alternative is to attach the case to the side of the rear carrier, but unfortunately the vibration is at its maximum here. [Why not the foot-board?—Ed.] Whatever the position, the battery must be placed in a strong metal case securely attached to the frame by steel clips and screws, and provided with a hinged door. On inserting the battery, make the connections, then pack tightly in place with strips of rubber to prevent any chance of movement, and it is a good plan to attach a piece of sheet rubber to the top of the case inside, by means of fish-glue, to prevent the terminals of wire short-circuiting to the case.

The best kind of wire for the connections between the lamps and battery is the brass spirally armoured two-core cable, as used for motor car lamps, but a cheaper substitute, which will be found quite as satisfactory provided care is taken to prevent fraying by contact with sharp projections, is the ordinary twin circular workshop flexible, which has a black weatherproof finish of impregnated cotton braiding on the outside, while the core will consist of two sets of thirty-five strands of No. 40 gauge wire, possessing great flexibility and ample current-carrying capacity.

Both head and tail lamps should have self-contained switches, as this simplifies the wiring and reduces the possibility of loose connections and short-circuiting, and to prevent the wire swaying it should be clipped to the frame with the soft metal clips sold for use with Bowden wire.

The battery will run the lamps continuously for from twelve to fifteen hours on one charge. If continuous current electric light is available in the house, this charging can be performed either during the daytime if much night riding is indulged in or at stated intervals during the week. The most economical method of charging off the house supply is to connect the battery in series with the lamps of a room which is in use nightly, the reduction in light thus caused being almost imperceptible, while the cost will, of course, be nil, as the lamps would be used in any case.

### Charging the Battery.

The connections can be arranged by removing the tumbler switch controlling the lamps and substituting a new tumbler switch of the two-way pattern and a two-pin wall plug and socket. The permanent wire connections are then remade in accordance with the diagram, and a pair of loose wires, preferably coloured red and black, are attached to the removable plug for connection to the battery as required, and it will

Diagram illustrating the method of charging from the house lights.

be necessary to ascertain which of the two plug wires is connected to the positive (+) source of supply, as this wire when found must always be coupled to the + battery terminal. To find the polarity of the supply, insert the plug in the wall socket, put the switch into the charging position, and dip the bared ends of the two plug wires into a tumbler of vinegar and water. In a few seconds bubbles will be seen

collecting on the negative wire.

When the battery is to be charged it will now only be necessary to connect up the terminals to the plug wires, insert the plug, and switch on until the acid in the battery bubbles furiously and assumes a slight milky colour, owing to the presence of gas bubbles.

When fully charged it can either be immediately disconnected or the switch changed over to the ordinary lighting position, when the battery will be cut off from the supply, and no harm will result even if left in this way for some time.

The one disadvantage of this method of charging is the length of time required owing to the small amount of current consumed by the modern electric lamp, and for purposes of calculation a 200 volt 25 watt metal filament lamp can be assumed to require one-eighth of an ampère, or a 16 candle-power carbon lamp on the same voltage one-third of an ampère. The total number of lamps controlled by the switch should be added together to obtain the actual current passing through the battery, and this sum total must not exceed the maximum charging rate marked on the battery, which is hardly likely to be the case.

As a final warning, never allow the battery to run down so low as to make the filaments appear red-hot only, and never leave the battery in its discharged condition a single hour longer than absolutely essential.

FRANCIS E. SCHOFIELD.

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

### Popping in Carburetter.

**?** What is the cause of "popping" or backfiring in the carburetter? It only occurs at slow speeds or when starting up, but immediately stops if I flood the carburetter.—C.S.H.

The trouble referred to is usually caused by too weak an inlet valve spring or too weak a mixture. It appears to be the latter cause in this instance, because flooding the carburetter seems to cure it. Consequently, shut off the air when you are driving slowly, and see that there are no air leaks in the carburetter or induction pipe unions.

### Burnt Contact Points.

**?** I shall be glad if you can help me to solve the following difficulty which I am having with the U.H. magneto of my 5-6 h.p. 1914 twin. The magneto worked all right until, say, 11,000 miles, when serious misfiring occurred, and the points were found to be very badly burnt. I bought a new pair of platinum screws on April 15th of this year, and they gave no trouble until July 15th, after 916 miles, when I found, as misfiring began again, that they too had burnt out. I took them to an efficient engineer, and he said he suspected the condenser of the magneto. He made a thorough overhaul of the magneto, and found that, except for a small amount of dust, it was in apparently perfect condition. I refitted the magneto, put in two more platinum screws, and ran the machine from July 25th to August 17th, when, after 368 miles, serious misfiring started again. I then fitted a new pair of Jebron points. After a further 278 miles I examined the points (not having had any serious trouble with them) and found that the shorter screw on the lifting part of the make and break was burnt, the heat having caused a small hard dome of metal, which I had to hammer flat again to get a good contact. I am again running on the points and awaiting my next misfiring trouble and consequent call for fresh points. I had a set of new high-tension cables fitted not long ago so that there might be no fault there. If you can kindly help me to stop this trouble I shall be grateful. The short screw on the lifting part is the one that burns away very soon, and then the fixed longer screw becomes affected and chars and burns after a time.—T.W.J.

Your trouble is undoubtedly due to a faulty condenser. The adjustment of the points would not affect this. We would advise you to have the magneto thoroughly overhauled by a reliable firm.

### Hot Air Intake.

**?** In your issue of August 17th, on page 139, "How to Economise," you show a sketch of a pipe attachment to fit on Senspray carburetter on bottom right-hand corner, supposedly to heat the cold air before entering and mixing with the petrol spirit to the engine. My machine is a James. Could you give me a fuller description, with size or bore of pipe required, and the number of coils you would recommend round the exhaust? I might say that the carburetter fitted to my machine is a Senspray. Furthermore, would it be advisable to take out the gauze at the intake?—H.T.

The pipe should be the size of the outside measurement of the spraying funnel. Two or three turns round the exhaust pipe should be sufficient. We should advise you to leave the gauze in position, and only make a hole in it for the tube to pass through. If possible, we think you would be better advised to fit a large tube to the total air intake, and draw all the air from some portion of the engine in close proximity to the exhaust pipe or combustion head.

### Pre-ignition.

**?** I have a 1915 6 h.p. combination, which runs splendidly on the level, but (1) when taking a hill it is altogether against picking up; hills must be rushed with it. When I open out there is a tinkling sound coming from somewhere in the neighbourhood of the magneto, which sounds as if someone were knocking the frame with a piece of wire. This occurs when there are no signs of the engine knocking; in fact, I have scarcely ever heard the engine knock, as the tinkling starts first. Since using a half-and-half paraffin mixture, this tinkling is very much more frequent and pronounced, and that on hills which ought to be easily climbed. I have retarded the spark, and shut

down the air, but with no effect, and the tinkling only ceases when the petrol lever is slightly closed, and then only for a few seconds, when it must be closed further. (2.) The compression of the engine is not what it should be, for when hot I can push it against compression when in top. The valves are well ground, and there is the correct clearance between valves and tappets. The piston rings are quite free; but I have noticed, on each occasion when I have had the engine down, that the slots in the rings have worked their way until they stand one above the other. If you can give me any advice upon these questions I shall be greatly obliged.—J.A.O.

(1.) The tinkling sound of which you complain is probably caused by pre-ignition, which will be likely to be more serious when using paraffin. It may be cured by using less air, or possibly by changing the plugs, as pre-ignition can quite well be caused by plugs of unsuitable design, the points of which get red hot. (2.) If the slots in the piston rings get into line, loss of compression will probably result. Before replacing the cylinder, after taking the engine down, you should see that these slots are equally spaced.

### Large v. Small Valves.

**?** (1.) Do large valves make an appreciable difference in the power of an engine, and can one purchase an instrument for enlarging valve seatings in diameter so as to fit larger valves? Are small seatings (narrower) better? (2.) Is really thick-bodied oil the best for hot air-cooled engines, especially if the compression is rather poor (owing to worn cylinder), as few agents seem to stock it? Personally, I should have thought the thicker the better for hot engines. (3.) Are the standard speedometer gear wheels fixed on the right side of the front wheel?—H.G.B.

(1.) Certainly large valves make some difference, but you must bear in mind that you get practically the same effect, only in not quite such a scientific way, by having small valves and a large lift. As to whether or not you can enlarge the seating depends upon the amount of metal at your disposal, but there is a tool for enlarging valve seatings sold. There is not much object in a narrow seating. (2.) It is best not to use too heavy an oil, but probably the best type is one of medium thickness. Deal with a first-class firm of oil refiners, who will recommend the most suitable lubricant if you tell them the make of your engine. (3.) Speedometer transmission wheels are fitted on the right-hand side.

### IMPORTANT NOTICE.

#### GOODS MADE IN GERMANY.

The proprietors of this journal, being fully in accord with the recommendations agreed upon at the Paris Economic Conference, give notice that they will not permit the advertisements of new goods manufactured in enemy countries to appear in this publication, either during or after the war.

ILIFFE & SONS LTD.

### T.T. Dimensions.

Q.

Would you kindly answer the following questions for me, to settle an argument: (1.) For how many years past has the 500 c.c. limit applied to entries for the Senior T.T. race. (2.) Has a four-cylinder F.N. competed in the Senior T.T. of late years? If so, what were its dimensions (bore and stroke)?—D.P.C.

(1.) The 500 c.c. limit has applied to all entries for the Senior T.T. Race since 1912. Previous to 1912 only the single-cylinder machines were confined to 500 c.c., but twins were allowed a considerably greater capacity, as it had previously been considered that a twin was less efficient than a single of the same capacity. However, the performance of the twins in the T.T. (where for several years a twin-cylinder machine won the race) rather disproved this theory, so in 1912 the capacity for both twins and singles was reduced to 500 c.c., where it has remained ever since. (2.) A four-cylinder F.N. motor cycle competed in the Senior T.T. Race in 1914, its bore and stroke being 50×63 mm., 495 c.c.

### New Clutch Plates.

Q.

A week or two ago I purchased a new set of plates for my 1913 3½ h.p. Triumph free engine clutch and had them put in by a local man. The clutch is all right when "in," but I cannot get free engine with the ordinary movement of the rod, and in order to get it have to screw up the clutch operating rod as far as it will go. Then, of course, when it is screwed up so far the clutch will not come "in" properly and slips badly. What do you think can be wrong? The man who put the plates in seems at a loss, and can only advise me to try to adjust it, but it will not "adjust."—J.M.

Your trouble may be due to too large a number of plates being fitted. Try having one or two removed. Owing to the plates being new they may be slightly rough, but will improve after having been used a little. You might try thoroughly washing out the clutch with paraffin, working the clutch pedal up and down while the paraffin is running through. Having done this you inject thin clutch oil. If the plates are a good fit there is no reason why the clutch should not work if correctly adjusted.

### Two Sparks in One Cylinder.

Q.

I have a 1913 free engine Triumph. I have taken the compression tap cock out of the top of the cylinder and fitted a small Sphinx plug in its place, still retaining the usual Bosch plug in its standard position. (1.) If I connect the top of the two plugs with a short length of copper wire shall I get a spark simultaneously from each plug? (2.) Shall I get more even firing and power? (3.) Will it do the magneto any harm? (4.) When overhauling the engine, to swill the crank case out I half fill it with paraffin oil, and then run the engine for about five seconds. Is this a wise thing to do?—R.M.

(1.) No, you will not. The current will take the line of least resistance, and will

spark in whichever plug the current finds the easiest path. (2.) Consequently this would make no difference to the running, and (3) will not affect the magneto in any way. If you wish to have two sparks in the cylinder you will have to use a double-pole plug or have a special magneto. (4.) It is better not to start the engine with paraffin in the crank case. This washes the lubricant from the bearings, and starting the engine would be rather risky.

### Overheating.

Q.

My mount is a 1911 7 h.p. Rex. o.i.v., long stroke, and I am troubled with overheating. I have had the machine two years, and have never been troubled with overheating before taking it down recently. It gets so hot that it will not pull even on low gear. The engine is clean inside, and I drive with ignition as far advanced as possible without knocking. I may say I have tried all positions of magneto timing, and the valve timing is correct.—G.H.

It is very difficult to say what is wrong with your machine from the particulars you give. The usual causes of overheating are as follow: (1.) Too rich a mixture, caused by enlarged jet; too high a petrol level; choked gauze in carburettor air inlet. (2.) Under or inefficient lubrication. (3.) Choked exhaust outlet. (4.) Insufficient lift of exhaust valves, caused by too great a clearance between valves and tappets. This should be about .4 mm. (5.) Incorrect valve timing. Exhaust valves should close when the pistons are exactly on top of the exhaust stroke; inlets should open immediately after. Use a good make of plug, with stout electrodes. Make sure all machine and gear bearings are quite free.

### RECOMMENDED ROUTES.

#### LIVERPOOL TO IPSWICH.—G.H.

Liverpool, by ferry to Birkenhead, Chester, Nantwich, Stone, Weston, Rugeley, Armitage, Lichfield, Fazeley, Atherstone, Smockington, Lutterworth, Husbands Bosworth, Market Harborough, Kettering, Thrapston, Huntingdon, Godmanchester, Fenstanton, Cambridge, Linton, Haverhill, Baythorn End, Cavendish, Long Melford, Sudbury, Hadleigh, Ipswich.

#### MANCHESTER TO ABERYSTWYTH.—C.S.

Manchester, Altrincham, Mere Corner, Northwich, Crabtree Green, Chester, Rossett, Llandegla, Corwen, Bala, Dolgelly, Machynlleth, Talybont, Aberystwyth.

#### ROTHERHAM TO BLACKPOOL.—C.D.

Rotherham, Mexborough, Marr, Ferry Bridge, Aberford, Harewood, Otley, Ilkley, Skipton, Gisburn, Clitheroe, Preston, Kirkham, Blackpool.

#### PETERBOROUGH TO CHATHAM.—G.W.G.

Peterborough, Norman Cross, Alconbury Hill, Huntingdon, Godmanchester, Royston, Buntingford, Ware, Harlow, Chipping Ongar, Brentwood, E. Hornden, Tilbury, by ferry to Gravesend, Rochester, Chatham.

#### FARNBOROUGH TO HARPHAM (YORKSHIRE).—F.S.K.

Farnborough, Bagshot, Ascot, Windsor, Uxbridge, Rickmansworth, St. Albans, Codicote, Hitchin, Biggleswade, Eaton Socon, Alconbury, Norman Cross, Stamford, Grantham, Lincoln, Brigg, New Holland, Hull, Beverley, Great Driffield, Harpham. Approximately 230 miles.

### MOTOR CYCLES FOR HOSPITAL NURSES.

Motor cycles are becoming quite popular among nurses who have to travel some distance from their homes to the different hospitals they attend. Our photograph of a 4 h.p. Douglas sidecar shows a nurse wearing a Striside skirt, which when the wearer is dismounted looks in no respect different from an ordinary walking skirt.

## American 1917 Tendencies.

### Trend of American Design as indicated by Features of Next Year's Models.

**A**LREADY particulars of the 1917 models of a number of American makes of motor cycles are coming to hand, and quite a number of the improvements and alterations are worthy of notice. The chief point which impresses one on seeing most of the new models is the decided tendency towards British appearance. At one time the American motor cycle, like nearly all other American machinery, was a type entirely on its own, but as each new year's model is introduced one sees less of the flimsy, gadgety fittings invariably found on these machines, and more and more of the solid and substantial outlines usually associated with machines of British build.

In considering the few makes already shown in their 1917 form, probably the point which impresses one most is the fact that all are equipped as standard with three-speed countershaft gear boxes and all-chain drive. Even the four-cylinder Henderson which, as most riders know, has hitherto been content with a two-speed situated in the rear hub, has now a gear of the three-speed type, which forms a portion of the power unit. In our description of a trial of this machine, which appeared in our issue of November 4th, 1915, it may be remembered that we pointed out that the space at the rear of the engine was simply asking to have a gear situated in it. In connection with gears and clutches a point which seems to be becoming fairly universal on all Yankee mounts is the device which interconnects the gear change lever and the clutch operating mechanism, so preventing the gear lever from being moved unless the clutch has previously been disengaged. The operation of the clutch in most cases can be performed either by hand or foot at will.

#### Bowden Wires becoming More Popular.

This dual control is a point which has received a certain amount of attention of late in this country, the difference between the two systems being that where it is fitted over here the hand-controlled portion is usually operated by Bowden mechanism from the handle-bar, whereas the American method is almost universally by means of levers and rods, the operating lever usually being situated on the tank side. Speaking of controls reminds one that the various controls, such as spark, throttle, valve lifter, brakes, etc., are in nearly all cases still actuated by means of rods and levers, the flexible wire system apparently not finding any great favour. On the other side of the Pond. But a few makes are now beginning to adopt wires to a greater

extent, though in most cases in conjunction with the twist grip method of control for throttle, valve lift, and spark. On one or two well-known machines the flexible wire system appears for the actuation of the second brake, a fitting which, owing to the law of this country, has usually figured on machines imported into England, but until quite recently has, on most machines, been conspicuous by its absence on those sold in America.

Kick starters and footboards, too, are apparently rapidly replacing the pedalling gear which until quite recently was almost universal on American mounts.

#### Large Kick-starter Pedal.

One well-known firm has made a simple improvement to its recently-adopted kick-starter, which corresponds with a point recently raised by "Ixon" in these columns, viz., a kick-starter pedal with a more generous surface for the foot. In this particular instance the pedal is formed by a substantial bicycle pedal, after the manner of the Lea-Francis, which, when not in use, folds neatly out of the way. The footboards, when fitted, are nearly always made so as to fold up—a system now fairly well known to British riders since the Indian people introduced it some years ago, but which never found favour in British-built machines. This type of board is undoubtedly a useful fitting, at times rendering storage easier and often saving considerable damage owing to a spill when riding solo.

#### Engine Design.

When considering the points of engine design, one immediately notices the increasing disappearance of the detachable cylinder head, which at one time formed a popular American type, while the side-by-side position for the valves on touring models seems to be increasingly popular. Roller bearings are becoming common, and on several of the better-known makes are being adapted not only for big-end bearings, but, as on at least one well-known make, they also form the main engine-shaft bearing in place of ball bearings. Mechanical lubrication has now become almost universal, the simple adjustable plunger pump forming the means on most machines. Simplicity of production and reduction of parts, especially those of the small variety, are undoubtedly beginning to be the aim of the American designer, whilst strength and lightness, consistent with cheapness of production, are also aims worthy to be followed.

The stands are now nearly all made of light girder metal formed in one piece

with no brazed joints. Front wheel stands are making an appearance on some of the American models. It is curious that, although front stands were made for the machines intended for this country, they were rarely supplied on those intended for the home market. This also applies to the extension of the front mudguard over the front wheel; this fitting appears to be universal now.

The new American Harley-Davidsons are equipped with a front stand, which is fitted to the main frame just beneath the engine, a feature which has the advantage of allowing the steering head to be quite free for inspection and adjustment when jacked up. The hollow type of wheel spindle, always fairly common on American motor cycles, is now more popular than ever, and is, in fact, practically universal.

#### Spring Frames.

In spite of the fact that rear sprung frames had their origin practically in America, as far as can be at present seen, little seems to have taken place in the way of manufacturers taking up this type of frame generally. Spring seat pillars and auxiliary saddle springing, however, are fairly common. Another point of interest lies in the fact that, whereas in England short semi-T.T. handle-bars are becoming almost universal for touring mounts, the Yankee still seems to adhere to the long upturned pattern. This is probably due more to the twist grip control than to the more comfortable position gained.

#### Single Cylinders.

The single-cylinder has always been a more or less neglected pattern, and although most of the manufacturers still continue to list and manufacture a single-cylinder model, little enthusiasm seems to be displayed in it. Nearly all American singles have been fitted with the engine in a more or less inclined position, and although this principle appears to be most popular, there is certainly a tendency to assume the vertical position. The new Reading Standard single, for instance, has the engine practically in a vertical position, but for some reason or other it is still very slightly inclined backwards.

An important point in American motor cycles is that nearly all makers are following their bigger brothers, the car manufacturers, and turning out their outfits ready for the road complete with lighting installations, horn, and so on. The dynamo lighting outfits are becoming very popular, and nearly every firm of repute lists at least one model so equipped.

## TYPES OF AVON TYRES—Nos. 7 and 8

# "Light-weights"

THE introduction of Avon "Light-weight" Covers met the large and rapidly-growing demand for tyres suitable for the popular two-strokes, "motor-cyclettes," etc.

The Avon "Light-weight" Covers have been specially designed for this type of mount, and embody adequate strength and endurance with minimum weight, together with the essential qualities of pace and safety. They will be found to hold the road at all speeds, under all conditions, and prove exceptionally reliable in cornering.

No. 8.—As above, but round-studded tread and slightly heavier casing.

Note the stout 2-ply casing and overlapping bead-flaps.

## CORNERING

A point of advantage in the Dunlop non-skid motor cycle cover lies in the fact that when the main studs wear to the level of the main rib, they still have non-skidding properties, because they are not central on the rib but project for half their diameter outside the rib. No. 1 stud, for example, projects on the right hand side of the rib and No. 2 on the left hand side and so on alternately, while the subsidiary studs remain equally operative during the life of the cover.

We would point out that a small pattern non-skid with twice as many studs as the Dunlop is not nearly so effective. Many people have attempted to copy our design, but are unable to do so owing to its being patented.

## "TANK" TALK.

### FURTHER OBSERVATIONS ON THE NEW ARMoured CARS.

SOME of our raw recruits are very excited. One asked his sergeant the other day how long it would take to rise to the rank of Tank Commander.

I heard an old lady on an omnibus ask a "Tommy" just how "these new water-tank things" were worked. "Well, mum," answered the soldier, with a twinkle, "just we fills 'em with an 'ose, then we dashes up to the German trenches, hauls the beggars out by the scruff of the neck, and—drowns 'em!"—Mr. Mayfair in *Sunday Pictorial*.

The secret had been well kept; even inhabitants of towns in which the armoured cars had been made were unaware of the existence of such death-dealing machines.

More men of the Motor Machine Gun Service have joined the ranks of the Heavy Section, Machine Gun Corps.

The officers and men at the camp of the Heavy Section are extremely proud of the exploits of their *confrères* in France, and the majority are keen to get to the Front and show their capabilities. The confidence of the men in their juggernauts is good to listen to.

The fact that the armoured cars were christened "tanks" misled many as to their motive power, and our mention of petrol engines last week came as news to many. "Kuklos" of the *Daily News* says: "The name 'tank' seems to suggest water ballast to put the weight just where it is wanted *pro tem*." I made sure they would be steamers."

Thrilling stories of the adventures of the "tanks" are added by Mr. Percival Phillips to those already narrated. He writes: Let me begin, haphazard, with the story of an "emergency" tank—thrust into the order of battle at the last minute with a "scratch" crew, with instructions to fight on our extreme right above Combles. Through no effort of the frightened Boches, the steering gear went wrong, and the pilot could only travel straight ahead. This he did. He eventually found himself astride a German trench on the outskirts of Combles—a little out of his reckoning. Here he halted, enfilading the trench repeatedly, until a chance shell of large dimensions hit the car, making it impossible to move forward or back. For five hours the crew of the "tank" worked their guns, while parties of German and British bombers

lobbed their missiles across from opposite sides. Eventually the Germans were killed or driven off, and the crew of the "tank" returned safely through a deadly enemy barrage. A second "tank" had a hectic experience in Bouleaux Wood. It travelled about half way up the wood until in a position enabling it to enfilade the enemy's trenches. Then the commander discovered that the infantry were not coming up behind him, so he went back for them. Again he went forward, with the infantry following, passing over enemy trenches and continuing his journey to the outskirts of Morval. Subsequently the commander

#### Found that he was again alone.

Not wishing to keep all the fruits of victory for himself, he again turned and went back to find the infantry, for whom he was acting as a kind of chaperon. He made a return journey of more than 1,500 yards in their direction, and then discovered that the infantry had been held up by a group of machine guns, which had been turned on them from a trench previously reported as unoccupied. Calmly hoisting itself astride the trench, the "tank" took a hand in the firing, knocking out one machine gun after the other until the trench was unoccupied—save by corpses. Unfortunately the "tank" became wedged in an unusually deep crater, and the crew could not extricate it, even though they emerged and tried to dig it out—with the enemy firing at them from another trench seventy yards away. Then the fun really started. Parties of German bombers worked around to one side of the car, while British bombers from the infantry took cover on the opposite side. The ensuing duel lasted an hour and a half. The Germans tried to drop their bombs on the roof of the "tank" without success. A corporal of the "tank's" crew seized a German bomb which fell among his companions, and tried to fling it back, but it exploded, blowing him to pieces. Eventually the German bombers were driven off, and the crew returned to the British lines. In one group of advancing "tanks" eight out of ten reached the point to which they were directed at the beginning of the offensive.

#### North-west of the Ginchy Telegraph

one of this group silenced a group of six machine guns in a redoubt, concentrating its fire on one after another. All of them did useful work in clearing other machine gun parties out of craters. The enemy had poised his guns on the far lip of the crater, and it was extremely difficult to spot them in the tumbled earth. Another

"tank" in this group captured a trench full of Germans just east of Delville Wood. The pilot saw a white flag waving violently and advancing towards him as he was about to halt his "tank" on the trench and sweep it from both sides. Behind the white flag streamed a long procession of unarmed Germans with their hands in the air. The "tank" accepted their surrender, and told them to pass back to the British lines. It was the good "tank" "Dreadnought" that went first into Flers. Very few Germans were encountered in the High Street, and they were promptly shot down. Flers was in a fair state of preservation, the streets were navigable, and some of the houses still standing; it has since been heavily shelled by the German guns. Three cars visited Flers on the first day, and remained until the Germans began their first bombardment of the place. There is a nautical atmosphere about the "tanks." Their officers salute Navy fashion. As one of them said to me, "You have to be everything from a mechanic to a sailor," and I am inclined to think they are as handy men as ever sailed the sea. You should have seen the "Cordon Rouge" plunging over a crater-filled valley on its way to report to a certain brigadier for duty. The ground was as tossed about and billowy as the sea, for not as much as a square foot had been left untouched by the enemy's shells. A smart young lieutenant slipped briskly through the hatchway and "came ashore," darted down the steep entrance passage three steps at a time, and came to attention before the brigadier with a quarter-deck salute. "Cordon Rouge" is ready for action, sir." "Right," said the brigadier, "don't bring it downstairs."

#### The Protestants.

We note with considerable pleasure that those excellent judges of inhuman warfare, the Germans, sometimes called Huns, are protesting to the Geneva Convention against the tanks. This is perhaps the finest testimonial that our gallant soldiers who man the armoured cars have yet received.

They say that it is not war, but bloodshed. May we reply with Mark Twain (quoting from memory): "'That's about the size of it,' said I. 'If it's a fair question, may I ask what your side was proposing to shed?'"

Lack of space prevents us from publishing a list of German atrocities. We will merely mention poison gas, poisoned wells, and disease germs in shells.

### Tank Talk.—

Sooner or later we shall hear a lot of these armoured cars. It so happens that there are a number of journalists forming the *personnel* of the Heavy Section, M.G.C. A member of the *Daily Mail* editorial staff, the assistant editor of the *Midland Daily Telegraph*, besides others, are represented, whilst three members of the section were formerly connected with *The Motor Cycle*.

The "Somme surprise," as *The Light Car* puts it, has been dubbed by the different papers such varied names as Juggernauts, Tanks, Caterpillars, Willies, Trench Destroyers, Ships of the Land, Iron Houses, Mobile Turrets, Travelling Forts, the Land Fleet, the Steel Monsters.

We have heard of more than one claim to have produced the armoured cars which are now "all the talk." Military and fiction writers forecasted them years and years ago, and we know an officer who revived the idea in the early stages of trench warfare, but was laughed at by fellow officers for weeks afterwards. There was an interval, and the subject was resuscitated, the tanks later becoming an accomplished fact, with what success we now know.

### Origin of the Tanks.

The following statement is issued by the Ministry of Munitions:

In view of the many statements, more or less erroneous, which have appeared in the press, the Ministry of Munitions desires to deprecate the circulation of statements regarding the origination and construction of the new armoured cars, commonly designated "Tanks." In due course an official statement will be issued giving the history and development of these machines, when credit will be given to whom credit is due.

It is only fair, however, to state that the design and construction of the first "tank" are due to officers working under the Admiralty. The Ministry of Munitions subsequently undertook to provide facilities for further experimentation, and for the construction and supply of these machines.

French Army lorry driving instructors. In the background are two British productions—a Tilling-Stevens lorry and a Triumph motor cycle.

A Birmingham lady, Mrs. George Powell, who uses her *de luxe* model Morgan in connection with the St. John Ambulance work. Note position of spare petrol tin.

### THE SOUTHERN PART OF SOUTH AMERICA.

**R**IGHT at the bottom of South America, in the town of Punta Arenas, are a number of motor cyclists, and we are told that British machines are preferred, solely by reason of their reliability and excellent finish. The first machine imported was an L.M.C. in 1911; now there are about forty. The L.M.C. is owned by a Mr. D. P. Bradley, who is at present at home. He speaks very highly of the way in which the L.M.C. has stood up to six years of heavy Overseas usage, and it must be gratifying to the makers, who have given more attention than the majority of other British firms to the requirements of Overseas riders.

In the early part of 1914 Mr. Bradley, together with a friend mounted on a Douglas, made a remarkable run across the continent at the bottom of S.A. The distance traversed was about 400 miles, being from Punta Arenas (Chile) to Port Gallegos (Southern Patagonia) on the Atlantic, and then across the Andes to Esperanza on the Pacific.

### TAKE IN THE AIR WARM.

**W**HEN we compare the carburetter on a car engine with the carburetter fitted to a motor cycle engine we notice one great difference. The carburetter fitted to a car, if it does not take in air specially warmed, has the inlet pipe hot water jacketed, is attached directly to the cylinder casting, of which the inlet pipe forms a part, and always

takes in air heated at least by the high temperature inside the bonnet. Now the main air intake of the modern motor cycle carburetter usually points away from the cylinder, and the air is naturally stone cold, but the idea is, presumably, to get a straight through passage so as to aid vaporisation. We are inclined to think that it is more essential to keep the carburetter warm. This is no new idea, as the old Longue-mares were exhaust jacketed, and often the fixed air inlet was fitted with a warm-air scoop, and this was in the days of .680 petrol. Leaving heavy fuels out of the question for the moment, and assuming that petrol is used, the difference between a warmed and an unwarmed carburetter is most marked. When either the air or the inlet pipe is heated the engine runs more regularly, pulls better, especially at slow speeds, and is more economical in fuel. The use of substitutes renders the heating of the carburetter essential, but we venture to think that even when normal conditions are resumed the hot air pipe in the warming jacket will be retained.

### S.O.S.

Extract from a letter received by the Editor a few days ago: "I always turn my petrol off about 100 yards before I stop, and I find immediately I shut off petrol—that is from the tank—the engine goes much nicer and increases speed 25%. Would an air leakage on the tank just above the tap cause this?"

### HIS MAJESTY'S PILOT.

We are told that on the occasion of one of His Majesty the King's visits to France the Royal car was piloted by a motor cyclist mounted on a  $3\frac{1}{2}$  h.p. James. We are further informed that His Majesty personally commented upon the smart appearance of the motor cyclist's machine.

# IT ALL DEPENDS ON THE TYRE

— but there is no need to worry if you are riding on Bates "British-built" tyres. The rough road, the sharp turn — neither has any terror for the cyclist thus equipped. A Bates tyre is safe at any angle. Its firm grip of the road will carry you safely over the most treacherous surface, and do it as well at the end of its life as at the beginning. That's the strong point about Bates protection. It lasts as long as the tyre does.

The British and Italian War Offices,  
The South African Defence Force,  
The South African Police, and the  
New Zealand Post Office have recently

# ROVER MODIFICATIONS FOR 1917.

Several Wartime Innovations on  
the Latest 3½ h.p. Rover.

**I**N these trying times, when manufacturers are engaged almost entirely on munitions, it is not surprising to find few real alterations in design, even when now and again the makers are able to produce a machine; in fact, the public should really consider themselves lucky if they are able to purchase a machine the details of which are by no means new. The Rover Co. have, however, introduced one or two small modifications in their standard motor cycle, which will appeal to the buyers of the limited number available. Probably the most noticeable alteration from the type which did duty for the past year or so is the wider petrol tank, which is now of such a size that it will hold a full two gallons of petrol, a good feature in these days of restricted fuel supplies. The change

Rear brake mechanism.

speed lever is mounted on a bracket clamped securely to the tank tube, the lever passing through an opening arranged in the tank. The tank thus takes the

place of the notched quadrant, an arrangement which undoubtedly gives a very neat appearance, in addition to permitting the lever to be in a most get-at-able position, and at the same time leaves the tank sides clear. Certainly the easy removal of the tank may be somewhat obstructed by this arrangement, while it of course adds some extra seams in the tank where leaks might occur.

## The Brakework.

The rear brake is a point where a small detail alteration has effected a considerable improvement. This consists of a small additional rod, connecting the brake

Rover tank showing location of gear change.

Observe the new aluminium chain cover and large silencer, which are features of the latest pattern Rover.

shoe to the fulcrum bracket in such a manner as to ensure an absolutely parallel motion for the shoe. The brake shoe, which is of the type actuating in the V of the belt rim, is pivoted on the short upturned portion of the actuating lever. If this were the only fixing it would be clear that the action of the rotating wheel would cause the shoe to tip, and cause undue wear at the upper portion of the shoe. By extending the attachment arm and connecting it by means of the small auxiliary rod to the fulcrum lug, the motion of the shoe is then constant in relation to the chain stays and belt rim. The cast aluminium chain case for the chain drive of the countershaft gear is also a recent improvement, which not only enhances the appearance of the machine, but is also more substantial and less likely to rattle than the sheet metal ones fitted previously.

## Other Interesting Points.

Since the outbreak of war quite a number of interesting features have been incorporated in the Rover motor cycle, of which, owing to the absence of shows and to interest in other matters, many readers may not have been aware. We therefore think that a short résumé of a few of the more interesting details will not be out of place. The front wheel brake, for instance, is quite a novel fitment. It is of the usual rim variety, operated by means of a Bowden cable; but, in order to enable it to be more effective, a simple arrangement of a lever giving much greater power is interposed between the horseshoe and the cable.

(Continued on page 278.)

Details of front brake mechanism.

1917 model Rover, which only differs from the 1916 model in a few details, and these are described in the accompanying letterpress.

## TIMES TO LIGHT LAMPS.

SUMMER TIME.			
Sept. 28th	...	7.16	p.m.
" 30th	...	7.11	"
GREENWICH TIME.			
Oct. 2nd	...	6.6	"
" 4th	...	6.2	"

### Airmen Motor Cyclists.

Mr. F. Hulbert, manager of the motor department of the Triumph Cycle Co., Ltd., went up in an aeroplane last week, piloted by his friend, Capt. H. Lister Cooper, who will be remembered as a leading motor cyclist.

### The Principal War Funds.

At the week-end the principal national war funds stood as follow:

The Prince of Wales's Fund	£5,957,162	0	0
(£3,468,925 distributed)			
British Red Cross Fund	4,365,306	0	0
The Queen's Work for Women			
Fund	170,625	0	0
Belgium Relief Fund (exceeds)	2,000,000	0	0
Kitchener Memorial Fund (exceeds)	303,000	0	0

### Why?

An interesting case was tried at Barnsley last week, where a motor cyclist was charged with driving a motor cycle and sidecar to the danger of the public. The defendant stated that he controlled the machine from the seat of the sidecar, an attitude which the Chairman described as ridiculous. In spite of the defendant's assertion that he had complete control of the motor cycle he was fined 20s.

### A Motor Cyclist Victim.

An unfortunate accident to a crippled motor cyclist is recorded in connection with the Zeppelin raid. This man was among the first to reach the spot where the intact Zeppelin fell. On seeing the Germans on the road he hurried for help. In the darkness he unfortunately collided with a motor car and sustained serious injuries to his leg, which may have to be amputated.

### Hill-climbing in Western Australia.

In cold, rainy weather, the Western Australia M.C.C. ran off a hill-climb at the Lesmurdie Falls Hill in July. The road was so bad, due to the rain, that there was some doubt as to whether the event would be run off or not, but competition was so keen that it was finally decided to send the men up.

#### Results:

UNDER 500 c.c.			
H. V. Norton (3½ h.p. B.S.A.)

UNDER 350 c.c.			
G. Norton (2¼ h.p. Sunbeam)			
L. Hope (2¼ h.p. Sunbeam)			
H. V. Norton made fastest time (1m. 5½s.) of the day and record for the hill.			

### Fifty Miles Road Race in Queensland.

The Indian lightweight has arrived in Australia, and won a fifty miles road race held by the Queensland Motor Cycle Club. The time was 1h. 31m. The scratch man, E. Lakey, on a 7 h.p. Indian, took 62m.

### Johannesburg-Durban Record.

Details reach us of an officially timed ride by two motor cyclists from Johannesburg to Durban. The two motor cyclists, who were mounted on a B.S.A. solo machine and Enfield sidecar outfit respectively, covered the journey in five hours less than the fastest train. The times were as follow:

B.S.A. solo	15h. 39m.
Enfield sc.	18h. 24m.
Train	23h. 22m.

The above times include stops.

### Chills in the Early Autumn.

The season is upon us in which dangerous colds are easily caught. On bright sunny mornings we leave home clad lightly, and return in the chilly night air shivering. The warning applies particularly to short-distance riders, who have only a mile or two to travel to and fro to business. In that short distance a chill may be caught that will last for months, especially at this time of the year.

### A SIMPLE CYCLE CAR.

The design combines the simplicity of a sidecar with the comfort of a small car. The engine is placed between the right-hand wheels as on the Scott Sociable, and the whole vehicle is a glorified double-seated sidecar with four wheels. Our sister journal, *The Light Car*, of yesterday's date, contains a fully illustrated description of this machine.

### Lamp Dimming Regulations.

A motorist was recently fined at King's Heath, Birmingham (where the restricted lights order is in force, which necessitates a thickness of tissue paper over the glass), for having instead a dimming disc with the usual six half inch holes over his electric lamp. Many motor cyclists are unaware that if this type of dimming disc is used (it is only compulsory in the Eastern Counties) it is necessary to use it in conjunction with the sheet of tissue paper in order to render it legal, even in districts where only one sheet of tissue paper alone is sufficient.

### A Fast Levis.

An interesting case was brought before the Belfast Court a few days ago. A rider of a Levis two-stroke was summoned for riding at the rate of 45 m.p.h., according to the police. The compliment to the machine and rider was overshadowed by a fine of 40s. and costs! We learn that the constable's method of checking the rider's speed was by slowly counting six, during which time he says the rider covered 250 yards. This antiquated method of timing is not always confined to Ireland.

### The Arbuthnot Trophy Fund.

Just before definitely closing the Admi Arbuthnot Trophy Fund the Auto Cycle Union received and accepted one guinea from East Midland Centre. This now brings up the total to the very satisfactory sum of £213 3s.

### Ha! Ha!

A reader writes: "The rider of a fix geared machine was causing amusement some onlookers in his vain endeavours effect a start. After many unsuccessful attempts and many more comments from spectators, he finally got away, and then triumphantly drew from his pocket a flag affixed at the front of his machine a small flag on which was written the word PARAFFIN."

### A £5 Reward.

A Norwich reader has written to Editor offering to pay any sum up to £5 for himself and a friend of his to be accepted together as clerks in the Motor Machine Service. It should be explained that the writer is a qualified shorthand-typist, and has been discharged from the R.F.A.

We have pointed out to him that the recruiting work of *The Motor Cycle* has throughout been purely honorary, and it resulted in an estimated saving to the country of several thousand pounds.

### How to Keep Warm.

On a particularly hot day last week we came across a motor cyclist lustily pedalling his machine on a stand. To our amazement he was endeavouring to start the engine on paraffin. We wondered how he had covered the four miles that separated him from home; but the distance one can cover in trying to start a refractory machine is wonderful, many of the old brigade know! Eventually he grasped the fact that motor cycle engines cannot be started on that fuel, and turned disgusted homewards, leaving his machine in the hedge.

### THE SHORTEST WAY

The owner of a Matchless sidecar shown in across country that was unknown to him. The to get assistance from a neighbouring farm. T

## American Sidecars.

Some of the American sidecar manufacturers will pay but scant attention to the sidecar. In an American contemporary we saw the other day that the designs were very decidedly inferior to those of British makers, and we could say also from the point of comfort we feel greatly. During the last two years the American sidecar has improved certainly, but America has nothing to compare with the best British makes.

## Tyre Wear.

The inequality in the value of identically priced tyres was again brought home to us the other day. On the rear wheel of a 10 h.p. chain-driven sidecar belonging to an acquaintance was a leading tyre showing the tread after running four hundred miles. The tyre on the sidecar was an identical one (which cost the same money). This one had been run on the above machine under similar road conditions, and had no damage other than a worn tread; but it had 3,000 miles on the rear wheel to its credit. We were assured that great care had always been taken with regard to the tension of the chains, so that the poor mileage was not due to faulty chain adjustment.

## Overseas Long Distance Road Records.

In several parts of the world not engaged in our great keenness is being displayed in lowering the times made by motor cyclists in covering the distances between certain towns. Thus, we are fairly frequently hearing of improved times for the Hobart-Launceston (Tasmania) and the Johannesburg-Durban (South Africa) roads. Between the chief Californian cities the competition also exists, and we hear that the Los Angeles-San Diego record now stands to the credit of Art. Holmes. Mounted on a Harley-Davidson, he lowered the previous record by 1m. 30s., in spite of a smash, resulting in a dislocated shoulder.

## ALWAYS THE QUICKEST.

He endeavoured to hasten his journey by cutting a shorter route than it looked, and the motor cyclist had started at the second kick upon reaching land.

## The Roll of Honour.

Great regret was expressed in Midland motor cycling circles at the news of the death in action of Lt. R. Wyley, of Coventry. He was a keen rider, and took part in some of the inter-Varsity competitions of the pre-war days. His father, Col. Wyley, is one of Coventry's foremost citizens.

## Armoured Cars or Submarines.

Many and varied are the yarns concerning the "tanks," and perhaps the most amusing is that recounted to us by an officer in the R.F.C. This is to the effect that they will go under water, one having been started at the bank of a deep river and coming out smiling on the other side in five minutes!

## The Standardisation Question.

The Secretary of the Engineering Standards Committee, Mr. C. le Maistre, writes that the question of standardising motor cycle controls may be taken up seriously in the near future by his Committee. The controls matter is becoming of more and more importance in view of the serious accidents that happen from time to time.

## Where to Repair.

In one of the busiest thoroughfares in Coventry we recently saw a motor cyclist apparently in trouble with his engine. Instead of drawing to the side, he commenced operations in the stream of traffic, indifferent to any inconvenience he may have caused. His obliviousness, however, vanished abruptly when a light car driver purposely missed him by what seemed a fraction of an inch, a huge trolley almost touching his sidecar at the same time.

## Road Surfaces in War Time.

The condition of many of the main trunk roads leading out of the Metropolis is very bad, so bad in some cases as to cause serious damage to any vehicle which passes over them. To neglect a road is false economy, and some time or other repairs must be effected which will prove far more costly than judicious mending at the right moment. The cause of the present sad state of affairs is, of course, due to an enormous increase of heavy traffic and to a shortage of labour. We have several times advocated the employment of German prisoners on this class of work, and it has been stated that this is being done in one or two cases, though not as generally as might be.

## Newhaven a Special Military Area.

For the benefit of those readers who did not see the Order of the Army Council published in the daily press of September 13th, it may be stated that Newhaven (i.e., the town itself and the area within the military defences forming part of the Urban District of Newhaven and of the parishes of Denton Urban and Bishopstone) has been declared to be a special military area under the Defence of the Realm Regulations. Persons desiring to enter the area are required, unless they come within the exemptions specified in Regulation 29B of the Defence of the Realm Regulations, to obtain a permit from the Commandant, Special Military Area, Newhaven. The necessary forms on which to make application for a permit may be obtained gratis from the police, and application should be made to the police station nearest the applicant's place of residence.

## SPECIAL FEATURES.

SINGLE v. TWIN.

ELECTRIC LIGHTING FOR MOTOR CYCLES.

"TANK" TALK.

## A Traffic Census.

A daily paper informs us that on a road which led to the spot where one of the wrecked Zeppelins was lying there passed thirty-three motor cycles and ninety-one motor cars in ten minutes.

## Volunteer Motor Cyclists Wanted.

Motor cyclists are wanted in the Essex Volunteer Regiment. Those of our readers who would care to volunteer for this work should apply to Sgt. A. H. Knight, 1st Essex Volunteer Regiment, B Company (West Ham), Motor Section, Town Hall, Stratford, E.

## To Tourists.

We are informed that the last nine miles of the Honiton-Ilminster direct road (avoiding Chard) is exceedingly rough and loose. Riders are therefore advised to go via Chard and Yarcombe. Also the direct road from Lichfield to Rugeley is very rough at present; a better route is through Handsacre and Armitage.

## Is Everyone Using Substitutes?

The return of summer-like weather over the week-end resulted in many machines being seen on the roads, and to all appearances there seemed as many riders, at any rate in the vicinity of the towns, almost as before the petrol restrictions came into force at the beginning of August. Thus we have further proof, if it were needed, of the popularity of petrol substitutes.

## Motor Cyclists on the Film.

At one of the picture houses in Coventry last week there was shown the film of Triumph testers performing all sorts of feats, from climbing 1 in 2 grass banks to riding through water with the engine half submerged. It is an excellent picture, and should do a lot to popularise motor cycles and at the same time demonstrate their complete controllability even under the most exceptional conditions.

## A Morgan Wanted Badly.

If any reader has a Grand Prix Morgan for sale, there is an offer in the advertising columns of our last issue of numerous vehicles for it in exchange. The advertiser referred to will give all the following for such a machine: "Well-known 1913 light car, two motor cycles, tricar, and Dennis car, and perhaps some cash." Some cash!!

## Rover Modifications for 1917.—

(Continued from page 275.)

The mudguards, too, are effectively valanced, and in order to maintain the accessibility of the rear tyre and to facilitate the removal of the rear wheel a neat and efficient type of combined hinged carrier and guard has been devised. By merely loosening two nuts the carrier complete with the whole rear portion of the mudguard and tool-bags can be swung up quite clear of everything.

## British Magneto.

The engine has remained practically unaltered since the outbreak of war, and still has dimensions of 85 x 88 mm., which give a capacity of 499 c.c.

On the machine which we saw an M.L. Coventry-made magneto was fitted. This magneto had a most business-like appearance, and was hard to distinguish from the one-time popular German-made machines.

Another simple fitting is a kind of disc adjuster on the rear spindle,

Rover belt adjustment.

whereby a certain amount of variation in the belt tension may be obtained without shortening the belt, which, in view of the somewhat short length of belt necessary with a countershaft gear, would undoubtedly at times prove extremely useful, allowing for more minute adjustment to be obtained.

To sum up, the fortunate purchaser of the present 3½ h.p. Rover will undoubtedly have one of the best thought out single-cylinders obtainable, and withal of irreproachable workmanship. Even these few small detail improvements go to prove that motor cycle manufacturers are not entirely unaware that improvements are possible, and when eventually peace arrives we anticipate with pleasure many surprises in the way of new designs.

## What is Motor Spirit?

THE great question at the moment is, of course, what is motor spirit, and, at the time of writing, it seems utterly impossible to obtain any definition from any of the Government Departments concerned. The Petrol Committee absolutely refuses to express a definite opinion, even though it is obvious that by refraining from doing so the Committee is encouraging the local police throughout the country to institute proceedings such as were taken recently against the proprietors of charrs-à-bancs at Conway, Bournemouth, and elsewhere.

The fact of the matter is, that whether or not paraffin and petrol substitutes of the white oil variety are to be regarded as motor spirits depends upon the Customs authorities. If these authorities succeed, as we believe they wish to do, in taxing paraffin and white oils as coming within the definition of motor spirit, the Petrol Committee will be bound to insist upon any sales of these fuels being recorded on the petrol licences. At the moment, however, the Petrol Committee is by no means anxious that the heavier hydro-carbons shall be included in the

definition, for the Committee would be involved in a great deal of additional correspondence if it was bound to control the sale of paraffin and white oils. We may take it, therefore, that at the moment the interests of the Customs authorities and of the Petrol Committee are antagonistic to one another. In all probability we shall not arrive at any solution of the problem until either the appeal from Conway has been decided by a Divisional Court, or the Law Officers of the Crown have been instructed by the Government to frame a definition.

## Auxiliary Petrol Tanks.

THERE is at the present time considerable demand for auxiliary petrol tanks which will fulfil two purposes. Firstly, to carry a small reserve of petrol, now that so many restrictions are placed upon the purchase

Brown Bros.' spare petrol tank.

of this fuel; and secondly to use the tank as an auxiliary for the purpose of starting the engine on petrol and allowing the petrol to be turned off after the engine has been warmed up, so that the driver can continue on paraffin or any petrol substitute.

Two sample tanks of this description are illustrated herewith. The first is a half-gallon tank, sold by Brown Bros., Ltd., 15, Newman Street, London, W., which is secured to the top tube by the aid of two spring clips. It has a large filler cap, a petrol union and tap complete, and is well finished in aluminium paint.

The other tank is made by A. Pilkington and Co., 54, Aston Road,

MOTOR ROLLER SKATES.

The power plant, a miniature V-type engine, is in this case used for the right foot, the other skate being merely a trailer. It is interesting to compare this with the Auto-ped illustrated on page 250 of our last issue. The motor skate hails from France.

Birmingham. It is finished in black, and holds two quarts of spirit. One of the chief features about this tank is the style of clip employed, which is quite secure, and yet allows the tank to be easily removed, and has a particularly strong fixing. A convenient petrol tap and union are supplied, while the only criticism we have to make is that the filler cap and orifice are rather on the small side.

Pilkington's spare petrol tank.

## 1,000 WOUNDED SOLDIERS BY CAR AND SIDECAR.

On Sunday last the National Motor Volunteers conveyed 1,000 wounded soldiers to a concert at the Albert Hall. A large fleet of cars and sidecars collected men from various hospitals around London, and the vehicles were divided into fourteen sections, all under the control of Commandant George F. Doland.

## BRISTOL AVOIDING ROUTE.

REFERRING to the paragraph in our issue of August 31st, a correspondent reports that the route suggested includes a hill which is in very bad condition owing to recent timber hauling operations, and suggests the following alternative: "Descend Rownham Hill, taking first turning to left over the bridge, or, as an alternative, go past the Zoological Gardens to the fountain, down Bridge Valley Road, follow the river towards Bristol as far as second bridge at the entrance to Cumberland Basin. Cross this and make for Long Ashton."

We now understand that the timber hauling work is practically finished, and when we passed this way a few weeks ago road repairs were about to be commenced. The hill should therefore soon be much improved, and even now is not impassable. We did not give our correspondent's route originally, as it might prove somewhat difficult for a stranger to follow. The roads on his route have also been considerably broken with military and motor 'bus traffic.

## PETROFIN AND POPS.

MAJOR NICHOLL, who is shown in a photograph on this page, has officiated as judge on the occasion of numerous A.C.U. trials. He is a clever amateur mechanic, and recently fitted a home-made mild steel inlet valve, which cost but half a crown and is giving excellent service, to his Bradbury. At present the machine is running on Petrofin, which gives good results, but is hard

A lady owner of a Hobart sidecar takes a convalescent soldier for a run.

to start on cold mornings. On a recent occasion, when no petrol was available for starting purposes, the difficulty was overcome by pouring a kettleful of boiling water over the carburetter.

"Pops" is as devoted to the sidecar as his master, and absolutely takes possession of any vehicle in which he is invited to sit, and should the poor owner attempt to move him or even take his coat off the seat "Pops" curls his upper lip, shows his teeth, and growls. He is a much-travelled animal, and once spent some time at Gibraltar.

## Average Prices OF Second-hand Machines.

WE give below the average prices of second-hand models offered for sale in *The Motor Cycle*. Where it is possible to obtain a sufficient number of each model the average for the past week is quoted, otherwise the last average is given, if within five weeks.

Major D. F. Nicholl, D.S.O., and his faithful rough-haired fox terrier "Pops," who accompanies him to camp in the Bradbury every morning.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

#### Salisbury Plain.

Sir,—In the article by "Bona Satis" in *The Motor Cycle* of last week, it is stated, "Beyond Roundway Hill, Salisbury Plain proper is entered." Roundway Hill lies to the north of Devizes, right away from the Andover Road, and there is only a second-rate by-road up to it. I conclude your correspondent means "Red Hone," on the direct Salisbury road from here, but even to one knowing the district it is not clear just what route was taken.

L.A.H.

Devizes.

#### Our Youngest Reader.

Sir,—The other day I journeyed by train from Norwich to Peterborough. At one of the intervening stations a lady, accompanied by a little boy, entered the compartment. The lady had in her hand a copy of *The Motor Cycle*. I wondered what she could be doing with it, for she was evidently not a motor cyclist. At length the secret was out. Turning to the little boy, whose age I learned was three and a half years, she said, "I have bought you your *Motor Cycle*, my dear." Then the little fellow, seated in the corner of the compartment with a huge Teddy bear upon his knees, perused the pages of your journal with an earnestness worthy of a keen motor cyclist. The lady told me that there was no paper he liked so much as *The Motor Cycle*. Surely among your many readers you have none so young, and few more enthusiastic than this little boy of three and a half years.

(Rev.) G. H. BEBB.

#### A Simple Vaporiser.

Sir,—Petrol having gone up in price, I endeavoured to economise with a vaporiser, but without success until I tried the following idea. I procured a small brass cap that would fit the top of the jet, drilled the other end, fitted a bit of fine wire gauze (as used for straining petrol), and then burred the edge over to prevent it being drawn out by suction. With this arrangement I can get more miles per gallon, more power, easier starting, a cooler engine, and can use more air. As I have derived benefit from the various hints in *The Motor Cycle*, I pass this tip on to anyone who cares to try it.

WIRE GAUZE

J. SIMONS.

#### 520 Miles on Four Gallons.

Sir,—It will no doubt interest "Ixion," after seeing his comment on "Auriga's" performance, to hear that I have just finished a run on a 1911 2½ h.p. Douglas of 480 miles on a trifle under three gallons of petrol and paraffin mixed half and half.

My route was by Lancaster, Garstang, Blackpool, Lytham, Preston, Wigan, Warrington, Chester, Wrexham, Oswestry, Shrewsbury, Ludlow, Leominster, Hereford, Ross, Gloucester, Worcester, Bromsgrove, Stourbridge (my tank ran empty at Stourbridge; I had used seven quarts—289 miles = 164 m.p.g.), Wolverhampton, Walsall, Lichfield, Derby, Matlock, Baslow, Chapel-en-le-Frith, Stockport, Didsbury, Stretford, Patricroft, Walkden, Chorley, Preston, Lancaster, and Benthams. I lost a good few miles about Baslow and on the outskirts of Manchester through missing my way, but have not included these.

As I am very keen on economy in running, I have been most particular in my figures. I fitted a hot air intake and covered the induction pipes with asbestos. I have to prime with petrol to start. I had no trouble at all with the machine. Some of the roads in Lancashire were so bad that I could hardly keep on the bicycle. Not bad for an old machine, is it?

W. H. GREENEP.

#### Petrol Substitutes.

Sir,—Being a rider of a Harley-Davidson, I wish to inform other riders of this machine that I have been running on pure Kempol without the use of petrol. Machine fires right off from first kick. I have been using it for the last two months, and I must say that I do not care if petrol is stopped altogether.

OTTO VIOLA.

Sir,—Recent letters from various correspondents on "Petrol Substitutes" at prices ranging round 2s. 6d. per gallon are a splendid indication of the way in which the public is exploited at times like the present. With petrol at 2s. 9d. per gallon, in which is included a tax of 6d. per gallon, the "substitute" is actually dearer than the petrol, which itself carries a large distribution and dealers' profit.

No substitute in existence is worth more than 2s. per gallon at present c.i.f. prices, and the balance is merely extra profit.

In common also, with some other trade periodicals, you have from time to time mentioned that Sir Hiram Maxim and other inventors were coming to the "rescue" by trying to invent some new process to render paraffin suitable for motor engines (page 255, September 21st). However, there is no need to invent any such process, three at least having been in large commercial use for many years converting paraffin and heavier petroleum oils to petrol itself.

There is no reason to-day why the public should not have petrol, if it wants it, at about the same price as is being charged for substitutes, or less, but its inability to combine where its interests are affected prevents it.

FRANCIS HYNDMAN (Lt.) R.G.A.

#### Four-cylinder Motor Cycles.

Sir,—Once in Capetown, some six years ago, I saw a machine with wheel steering, low bucket seat, spring frame, and four-cylinder engine, as near as I can remember. Was it not called the T.A.C.?

In these days of progress it appears to me that there was in the old T.A.C. the germ of a very fine 'bus. Why did it not succeed? Can you tell me?

Discussing the machine with the few motor cyclists I have met who ever saw one of its kind, I find we always finish on a note of regret that such a cycle is not to be had now. I shall never forget the thrill it gave me to sit in that bucket seat only about 18in. from the ground. And had not the machine three speeds with gate change? One is tempted to say such a machine must be the ideal specification.

FRED ROBERTS.

[The manufacture of the T.A.C. (later known as the T.M.C.) was largely disorganised owing to the war. Possibly a machine on the same lines will be revived ere long, as we have evidence that certain manufacturers are turning their attention to four-cylinder motor bicycles, and we have already proved the feeling of the riding public by articles in these pages. Similar machines to the T.M.C. are the 7 h.p. F.N., the Henderson, and the Militaire model.—Ed.]

"Not too proud  
to Spark."

# C.A.V. Magnetos

BRITISH THROUGHOUT

"After the lot of trouble experienced with certain magnetos I thought it only fair to let you know how satisfactory your productions are. I have never had occasion even to take the mag. cover off except for retiming, and speaking to an officer he said for twelve months he had not seen inside his mag., which was also a C.A.V., and in his words your magnetos are IT, and we have to fear German goods no longer."

### Adulterated Petrol.

Sir,—I have for some time suspected that petrol is being adulterated with paraffin, and I have been experimenting in order to find some chemical test which will demonstrate the adulteration. The following test will prove, more or less conclusively, whether petrol contains paraffin or not: Take a quarter of a test tube of petrol and add three or four drops of nitric acid ( $\text{HNO}_3$ ). There will be a distinct dividing line or meniscus formed which splits the solution into two halves. The top layer is petrol; the bottom is paraffin. Add a few drops of chloroform ( $\text{CHCl}_3$ ) and shake. A deep yellow precipitate will fall to the bottom of the tube, while a pale green precipitate will form at the top of the solution. This test is perfectly simple, and should be of use to motor cyclists who are doubtful as to the purity of their petrol.

E. J. LL. JONES-EVANS.

### The Cause of Overheating.

Sir,—As no abler pen than mine has replied to the letter of Mr. Clifford C. Fenton (September 7th), I should be glad if you will allow me space for a few words. Mr. Fenton is right when he says as the fuel expands with heat a smaller quantity will enter the engine, but, in my opinion, the difference will be but slight. When, however, he begins to employ figures he gets woefully "off the map." Boyle's law refers to degrees Centigrade, in which scale  $273^\circ$  is equal to nearly  $500^\circ \text{F.}$ ; the gas will, therefore, not double its volume in rising from  $50^\circ \text{F.}$  to  $300^\circ \text{F.}$  The size of the engine is immaterial. Can it be that Mr. Fenton is connecting a  $250^\circ$  rise in temperature in some way with a 500 c.c. engine?

Further, Mr. Fenton supposes that in extreme cases the quantity of gas which enters the engine is so small that the increase in volume caused by the explosion is practically negligible. This means that there is no noticeable increase of heat. But how can the incoming gases approach even distantly the heat of the explosion? They can only be heated by the hot parts of the engine with which they come into contact, and this is far below the explosion heat, for the heat is being rapidly carried away partly into the exhaust and partly by conduction through the cylinder walls and cooling ribs, or the whole engine would rapidly become red hot. Moreover, long before the explosion heat was reached,

pre-ignition would occur, with violent backfiring. It must be remembered, too, that the time in which the incoming gases would have to be heated (and the heating would, I think, have to be by convection, for the conductivity of gases is not high) is extremely small, about half a revolution or one-sixtieth of a second at 1,800 r.p.m.

I fear that Mr. Fenton's theory is not very enlightening, but Mr. Stephenson's article interested me exceedingly.

JOHN BONYTHON.

### Severe Scottish Road.

Sir,—It would be very interesting to me, having just covered the ground, to hear or know the experiences of Scottish and English tourists from Cock Wig to Tomintoul or *vice versa*. Roads so atrocious have to be seen to be understood; my pen absolutely refuses to describe their condition. What are the gradients in their steepest part? I used to imagine the Devonshire roads pretty bad and hilly, but the foregoing in the land of cakes "takes the bun." My machine—a 5-6 h.p. Bradbury—which has done 3,000 miles with cleaning, went over without a hitch, and it is a tribute to the workmanship and material that the frame stood the racket. The load was 33-34 stone.

Leslie, Fife.

S 5780.

[Our correspondent has undoubtedly selected a very severe stretch of the Highland roads to compare with the Devonshire ones. The particular stretch mentioned was included in the 1913 and 1914 Scottish Six Days Trials, and those who competed in those trials will have cause to remember the severe nature of this stretch. In most cases it is the length of the Scottish hills, rather than their actual gradient, which renders them so severe.—Ed.]

### Sidecar Outfit up Gibraltar Rock.

Sir,—I thought it would be of interest to you to know that the famous Rock of Gibraltar has been climbed by me on a 6 h.p. A.J.S. and sidecar, with Mr. Andrews, R.N.A.S., as passenger, combined weights twenty-five stone; this is the first motor cycle and sidecar to reach the top, I believe. The track leading to the summit rises 1,400ft. in a mile and half, and is composed of loose sand and boulders. Several times we had to lift the machine over waterways to avoid

### A SPORTING COMBINATION.

W. L. Horwood, R.N.A.S., who has climbed the famous Gibraltar rock on his 6 h.p. A.J.S. sidecar outfit. The track to the summit rises 1,400 feet in  $1\frac{1}{2}$  miles—1 in  $5\frac{1}{2}$  average.

hitting the crank case. A speed of more than seven miles an hour was impossible, as the machine simply skidded in the loose sand and in places an error would have meant a fall on the rocks hundreds of feet below. As an engineer and motor cyclist from the early days, I can fully appreciate the slow pulling qualities of the A.J.S. engine. The machine is a beautiful example of a modern sidecar outfit.

W. L. HORWOOD, R.N.A.S.

### American Motor Cycles.

Sir,—I do not wish unduly to occupy the space you could more profitably utilise in other directions, but I should like to make a brief rejoinder to Capt. Lindsay's letter, chiefly referring to the conservative policy of the manufacturers of my "leading single."

The term I used was "well-informed conservatism"—and justly so, since the policy of the Triumph Co. (to name my leading single) was never that of placing the client in the position of the experimental department, nor even to follow standard practice, but rather, as a result of ceaseless testing of every innovation, to create standard practice.

It was not want of knowledge of speed gears that caused the Triumph to be so long before the public as a single-gear machine, nor lack of experience in rigid drives that caused its adherence to the belt, but rather the reverse in each case.

The comment, spontaneously uttered by experienced workmen when discussing the merits of many machines, "if only the Triumph had made it!" is a tribute to Triumph workmanship which must be admitted without question.

I hope my praise is understood to be disinterested, since in civilian life it is rather to my disadvantage than otherwise to do so; at present, as a repairer in the M.T., A.S.C., I sincerely thank Capt. Lindsay for his offer of information concerning the Triumph he is so fortunate in using in more glorious circumstances than I am permitted to share, and would only remind him that, amongst the endless variety of machines used by the Army, I have every opportunity of observing which machines require the most frequent and extensive repair.

D. H. SMITH.

Sir,—As a regular reader of your paper, I always enjoy a perusal of the various letters you receive, and have lately been amused with the correspondence concerning the "points" of British machines of various types and the American high-powered models. Surely this question depends entirely upon the basis from which we start, i.e., what factor is to be the deciding one—speed, weight, reliability, economy, or what?

Speaking of my own case, which is probably analogous to the greater proportion of motor cyclists, I require a machine to take me from one point to another with the greatest possible (1) reliability, (2) economy, and (3) accessibility in case of breakdown. An extra mile or two per hour matters nothing. We are supposed to have a speed limit of 20 m.p.h., and it is quite fast enough travelling—except for the so-termed "knuts"—if a combination will do 30 m.p.h. in comfort.

My experience is that, taking the above as the three prime factors, there has been nothing yet evolved to beat the  $4\frac{1}{2}$  h.p. single-cylinder all chain-drive, with a good variable gear of three speeds. I am entirely unconnected with the motor trade (nor have I any relative in it), so have not even part of an axe to grind! I think honour ought to be given where it is due on the following facts. I bought a new outfit last Easter, as my old one was getting shaken to bits by the roads. I wanted a Norton. I could not get one. I bought a  $4\frac{1}{2}$  h.p. Quadrant combination of above type. Although I had not seen the machine before, I rode it straight through Manchester up to Skipton, from there over the worst Yorkshire hills with passenger and luggage to Pateley, then across country to Leeming Lane, and up to Corbridge-on-Tyne, over Alston to Penrith, and over Shap back to Skipton without a single hitch of any sort. I have ridden every day since, have done a 400-mile week-end run down to Hertfordshire and back, and have now done about 4,400 miles without a single stoppage from trouble. I have had no puncture, save a slight one in the sidcar tyre, which was mended in ten minutes. I changed the front tyre on to the back between 3,000 and 4,000 miles. Can one wish for anything better? Facts speak louder than words. My argument for reliability needs no addition.

As regards economy, I carefully tested the petrol consumption on my 400-mile trip, and did 75 m.p.g. with passenger and luggage, including about twenty miles of low gear work and pottering. Some of your

readers would appear to think such a result as this almost impossible.

As regards accessibility, my cylinder is exceedingly easily detached single-handed, and can be taken off, cleaned, and put back in an hour, and all other parts are quite as accessible as any reasonable being wants. I find one pumpful of oil per seven miles quite sufficient. Six pumpfuls make one gill. This combination will climb anything, starts quite easily with the kick starter, or, if preferred, can be started at a walking pace on low gear. The silencer is effective, and Terry's spring links added to the original spring forks make the roads of to-day quite comfortable riding. On my particular combination the tyres are extra heavy Dunlops. The gear is a B.S.A. three-speed, and the sidcar is a Canoelet; it is good to look at.

As regards the merits of the twin-cylinder, I maintain that in taking an equal number of cases of each the latter gives more trouble than the single. Your correspondence columns have proved this to me, apart from experiences of the road.

H.F.M.

Leeds.

### The Scott Sociable.

Sir,—It is with the greatest interest that I have read your account of the new Scott passenger machine in your issue of July 27th. The vehicle described appears to be a very good attempt to combine the proved qualities of the motor bicycle and sidcar with protection and comfort for the driver as well as the passenger, and if it can be produced at a moderate price its future looks rosy. It is the thing I have been looking for for years, and there must be thousands of motor cyclists with the same wants as myself, to whom it will offer an irresistible appeal.

Mayniyo, Burma.

R. STANLEY BAKER.

Sir,—May I, through you, congratulate Mr. Scott on his new sociable? His machine will give both driver and passenger the comfort of a car.

Cleanliness is a problem which will be solved both as regards the machine and driver. The latter will not require to wear the special clothing which is essential when riding the sidcar combination.

I see no reason why one of your correspondents condemns the design as being lop-sided. Why does he not say the same of the sidcar? Although in the accompanying design I have made an alteration, I do not suggest there is any fault to find with Mr. Scott's design, and comfort is the chief thing to study, of course combining elegance as far as is practicable. Great credit is due to Mr. Scott for producing a machine which has already been tested for a large number of miles and proved to be satisfactory, and which will without doubt prove to be very popular when it is placed upon the market.

I should like to add that I read *The Motor Cycle* with great interest, having it sent out to me every week by my brother, as I am in a place out here where it is not possible to obtain it.

S. WAY (Sgt.)

# MISCELLANEOUS ADVERTISEMENTS.

## PRICES.

**ADVERTISEMENTS** in these columns—First 12 words or less 1/6, and 3d. for every two words after. Each paragraph is charged separately. Name and address must be counted. Series discounts and special terms to regular trade advertisers will be quoted on application.

Postal Orders sent in payment for advertisements should be made payable to **ILIFFE & SONS Ltd.**, and crossed **& Co.**

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor St., E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

## NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charge. Only the number will appear in the advertisement. All replies should be addressed, "No. 000, c/o 'The Motor Cycle,' 20, Tudor Street, E.C."

## DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pay carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged, when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

## SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

## DEFENCE OF THE REALM ACT

Under the provisions of the above Act, advertisers requiring workmen, and whose business consists wholly or mainly of engineering or the productions of munitions of war, or substances required for the production thereof, and whose works are situated within 30 miles of London, must include in every such advertisement the words, "No person resident more than 10 miles away, or already engaged on Government work, will be engaged."

Advertisers whose works are situated more than 30 miles from London can only have their announcements inserted with the approval of the Board of Trade, who will allocate to each advertisement a box number, and collect and distribute to the advertiser all replies received. The necessary forms of application can be obtained from any Labour Exchange or from the offices of this paper, and each advertisement must contain a clear reference to the effect that no person already engaged on Government work need apply.

## PROMISE &amp; FULFILMENT

**We don't want to Boast, but it IS gratifying—when we recall our first advertisement in 1910 announcing a New Business, which would be run on absolutely straight lines—to be able to publish in 1916 (6 years afterwards) extracts from letters received from five different customers (all in the Army) expressing appreciation.**

**ALL THESE TESTIMONIALS ARE OF RECENT DATE, AND THE ORIGINALS CAN BE SEEN AT OUR OFFICE:**

1

I am sure it is a pleasure to do business with you, and shall have every confidence in recommending you on every opportunity as a Straightforward British Business House.

2

Your treatment of me through this transaction has been most considerate, not to say liberal, and I assure you that I shall lose no opportunity of sounding your praises in the far North.

3

I am very much obliged to you for yours of 14th inst., enclosing cheque. It is to my mind an evidence of your straightforward dealings, and I shall remember it.

4

I am very pleased to hear that you have disposed of my Indian—it is one more proof of the excellence of your firm.

5

I paid you £35 for the mount, and my friends with one accord agree with me that I have got a real bargain in motor bikes.

**If you want a New or Second-hand Machine it will pay you to write for our List.**

**Exchanges. Easy Terms.**

1916 Sporting Morgan, hood, screen, done 500 miles; £90.—T.D., 195, Cambridge Rd., Mile End. [2405]

A.C. 1914 2-seater, 6 h.p., Bosch, hood, screen, lamps, first-class condition; £42/10.—1, Ebner St., Wandsworth. [X8258]

1914 Morgan, in new condition, new tyres, complete hood, screen, lamps, etc.; £78.—Cross, Effingham Sq., Rotherham. [X8212]

A.C., June, 1913, perfect order, newly painted, completely equipped, spares; £55.—160, Croydon Rd., Beckenham, Kent. [X8286]

MORGAN New 1916 w.c. Grand Prix Model, oversize tyres, M.A.G. engine, with or without full equipment, in stock, immediate delivery.—Potter, Leicester Grove, Leeds. [X8236]

9 h.p. Twin Water-cooled 2-seater Cycle Car, 3-wheeled, dual ignition, 3 speeds, reverse, powerful climber, fast; £30, or exchange good 2-stroke or Douglas; photo, stamp reply.—Mead, Draper, Amersham, Bucks. [2252]

CHATER-LEA-ARIEL Cycle Car, large 2-seater, 6-10 h.p., water-cooled, 3 speeds and reverse, fitted with hood, screen, lamps, tyres, hood, excellent condition; £55, or nearest offer.—Hart, 48, Herne Hill Rd., Loughborough Junction, S.E. [2370]

KENDALL Carriage, Birmingham built, 1913, 8 h.p., underslung, light, and sporty, hood, screen, lamps, spare tyres, belts, chains, valves, etc., will run London to Brighton on top gear on one gallon petrol, fitted with double tank for substitute; £50, no offers; take motor cycle part payment.—8, Half Moon Lane, Herne Hill. Tel.: Brixton 1964. [2453]

## CARS FOR SALE.

FORD 5-seater, oversize tyres, well equipped; £65.—68, Horton St., Halifax. [0651]

FORD Touring Car, good and cheap; no dealers.—Greyhound Lodge, Glensford. [1656]

RITZ, new, 10 h.p., 4-cyl., 2-seater; £145, or exchange.—Collier, Deal St., Halifax. [0652]

DARRACQ, 8-10 h.p., 2-cyl., smart 2-seater, in real nice condition; £40.—6, Warren St., London. [2498]

2-SEATER Clement, good condition; drive away; £35.—Bellamy, 12, Melbourne Sq., Brixton, London. [2355]

HUMBERTTE, nearly new, hood, screen, accessories; £75; combination part.—Brown, 13, Mercer St., London. [2323]

SPORTING 12 h.p. Sizaire-Naudin 2-seater, detachable rims, fine condition; £50.—Owen, 151a, Oxford St., W. [2369]

PILOT Light Car, 8 h.p., 2-seater, torpedo, hood, screen; £45; exchange combination, cash either way.—Write, Newlyn House, Whetstone, N. [2506]

SAXON, 1915, 2-seater, complete, and in fine condition; £105, or reasonable offer; good combination considered in part payment.—Laytons' Garage, Bicester, Oxon. [X8321]

CHELSEA, 1916, new model, 2-seater. Ask us for particulars. We have a great bargain for some lucky individual, but—delays are dangerous, so write now.—Laytons' Garage, Bicester, Oxon. [X8322]

TRUMBULL, 4-cyl., 2-seater, quite complete, and almost new, worth £125, reasonable offers wanted; good combination considered in part payment, balance by deferred payments if desired.—Laytons' Garage, Bicester, Oxon. [X8323]

## EXTENDED PAYMENTS.

**EXTENDED Payments.**—All makes supplied; lowest terms.—Service Co., 292, High Holborn, London. [0618]  
**INSURANCE.**—Lloyd's motor policies payable monthly. Before insuring elsewhere write for prospectus.—Manager, General Insurance Co., 199, Piccadilly, London, W. [0810]

## ENGINES.

**J.A.P.**, 7.9-h.p., as new, cycle or car, 85x85; any examination, £21; also 3½-h.p. Brown pattern, £2; after 7.—Vallins, 29, Canterbury Rd., S.E. [2317]  
**POWERFUL** 3½-h.p. Rex Engine, m.o.v., complete with B. and L. carburettor and pulley, perfect running condition; £3/10.—Davies, Berkeley Rd., Poynton, Cheshire. [X8160]  
**24-h.p.** Twin Moto-Reve Engine, with h.b.e. carburettor, £3/10, new condition; magneto for same, £2; would exchange for higher power, or speed gear.—W.M., 42, Newington Green Rd., London, N. [2313]  
**TWIN** Riley Engine, 5.6-h.p., water-cooled, mechanical valves, complete with 3-speed and reverse gear box, also latest Bosch mag., perfect condition: £15.—103, Holmdene Av., Herne Hill, S.E. 'Phone: Victoria 6553. [2459]

## IGNITION APPLIANCES.

**PARKER and Rice**, Magneto Specialists; experts on all magnetos, Bosch, Eisemann, etc.  
**PARKER and Rice**—Re-winding, re-magnetising, overhauling, etc.; repairs executed with expedition and unapproachable workmanship; low quotations.  
**IMPORTANT.**—Parker and Rice give 12 months' written guarantee with each repair.  
**PARKER and Rice** have a large stock of spare parts for all makes and types of magnetos.  
**PARKER and Rice** have some good new and second-hand magnetos for sale, which will be guaranteed for 12 months.  
**PARKER and Rice** have taken over larger premises at Acton. Their address now is 75, Park Rd. North, Acton, London. 'Phone: Chiswick 1518. State your trouble. Let us quote you. [4605]  
**DIXIE** Magneto for sale, fixed ignition, almost new; £2/10.—Box 802, c/o The Motor Cycle. [X8273]  
**H.T.** Magneto for 6-h.p. engine; exchange 3½-h.p. W.C. De Dion engine.—80, St. Mary's Rd., Portsmonth. [X8288]  
**THE** Runbaken Magneto Co., Ltd., Camp Street Works, Manchester. Tel.: 8266 City (3 lines). T.A.: Runmag, Manchester.  
**MAGNETO** Parts for Bosch, Eisemann, U.H., and American machines from stock; send for illustrated catalogue, post free. Repairs can be returned within 48 hours. Wire or 'phone as your requirements.  
**THE** Runbaken Magneto Co., Ltd., Camp Street Works, Manchester. Tel.: 8266 City (3 lines). T.A.: Runmag, Manchester. [0404]  
**TWO** Bosch Magnetos, DA2, anti-clock, suitable for single-cyl. in good order; £2/10 each.—Smith, 14, Haverstock Hill, Chalk Farm. [2511]  
**MAGNETOS**—Boulton 2½-h.p. variable, waterproof, 55/-; 3½-h.p., 65/-; 4-cyl., 27/10, carriage paid. We can now deliver from stock.—Boulton and Son, Old Hall St., Wolverhampton. [X8227]  
**MAGNETO** Repairs and Spare Parts; all makes. Spare parts suitable for Bosch magnetos a speciality.—Simms Motor Units, Ltd., 191, Wardour St., London, W. T.A.: Simotunit, London. [0746]  
**MAGNETOS** Repaired by skilful workmen; expedition and moderate charges; several 1.2-cyl. machines in stock, every magneto guaranteed.—The Magneto Mart and Repairing Co., 142, Wardour St., W. 'Phone: Gerrard 727. [8814]  
**MAGNETO** Repairs of every description. We are the first original all-British experts from the Bosch Co., where we have had some years' experience. We guarantee every repair, and can return same in one day. All spare parts, also new and second-hand magnetos in stock.—The Magneto Repairing Co., 158, Seymour St., Euston, London. 'Phone: Museum 1158. [2558]

## TANKS.

**TANKS** Repaired and Re-enamelled, 10/6.—Bright and Hayles, 73, Church St., Camberwell. [1991]  
**SPARE** Tanks, 1 quart, 2 clips, filler, tap, and union, enamelled; 7/6, by return.—Attwoods, 86, Rosebery Av., E.C. [1009]  
**TANKS**—Tanks any shape to order, repaired, or enamelled, all-metal sidecar bodies; general sheet metal work; lists free.—Attwoods, 86, Rosebery Av., E.C. Tel.: Central 12445. [5591]

## TYRES.

**SEE** Bancroftian Advertisement under Miscellaneous. [0845]  
**BASTONE'S**—The cheapest house for covers and tubes. Huge stock to be cleared at low prices.  
**BASTONE'S**—Michelin heavy Trident beaded-edge covers (clearance), 26x2 19/-, list 26/6; 26x2 21/-, list 28/6; 26x2 2 23/-, list 31/-; 28x2 2 28x3 rim, 20/-; 700x65, 20/-, ditto wired edge, 26x2 2 18/-, list 28/-; 26x2 2 19/-, list 30/-; each including 3/- outfit free. Other bargains see last week's advert.—228, Pentonville Rd., King's Cross, London, N. Tel.: 2481 North. [2451]

## TYRES.

**ECONOMIC.**—Free. We present where stated below a 3/6 guaranteed Simms plug.  
**ECONOMIC.**—26x2½ heavy rubber-studded Midland Britannia 21/-, 26x2½ light 15/-, ribbed and rubber-studded 26x2 heavy 20/-.  
**ECONOMIC.**—Pirelli 26x2½ oversize 25/- (listed 39/-), 26x2½ 20/-, 28x3 Kempshall sidexar 16/6.  
**ECONOMIC.**—Special clearance of fully guaranteed but shop-soiled 26x2½ Kempshall heavy non-skids, 38/-, listed 48/-.  
**ECONOMIC.**—Kempshall clearance non-skids, 26x2½ 30/-, specials 32/6, 26x2½ oversize 35/-, 650x65 50/-, including free plug.  
**ECONOMIC.**—Kempshall clearance anti-skid, 26x2½ 22/-, 26x2½ oversize 23/6, 28x2½ 26/6, including free plug.  
**ECONOMIC.**—Enfield riders note 650x65 Kempshall extra heavy steel-studs, embedded in fibre, 47/6, fully guaranteed.  
**ECONOMIC.**—Special for Saxons, Indians, and Harley Davidsons. 28x3½ oversize extra heavy Kempshall steel-studs, embedded in fibre, 60/-, fully guaranteed.  
**ECONOMIC.**—Continental 26x2½ wired covers, oversize for 26x2, 10/6, pair 17/6.  
**ECONOMIC.**—Continental basket pattern, 26x2 16/6, 26x2½ 18/-, 26x2½ Model de Course heavy 19/-.  
**ECONOMIC.**—Large numbers of odd 26x2½, and 26x2½ covers from 7/6. State requirements.  
**ECONOMIC.**—Clincher 26x2½x2½ 6-ply Dreadnoughts 37/6, 28x3 fitted 27/6.  
**ECONOMIC.**—Wood-Milne heavy 28x3 grooved 27/6, 28x3 heavy Clincher de luxe non-skids, 35/-.  
**ECONOMIC.**—Wood-Milne special rubber-studded 19/-, listed 31/6, grip-ribbed heavy 20/-, listed 31/6; extra heavy 25/-, listed 39/-; including free plug.  
**ECONOMIC.**—Wood-Milne 26x2½x2½, for 26x2½ rims, special rubber studs, 22/6, listed 32/9.  
**ECONOMIC.**—Clincher tubes, 26x2 4/9, 26x2½ 5/3, 24x2 3/6; Continental 26x2½ 5/9, 650x65 6/6, 28x3 9/6.  
**ECONOMIC.**—Wood-Milne belting, ¼ 1/3; Continental, ¼ 1/-; Pedley, ¼ 1/3, ¼ 1/5, ¼ 1/8, lin. 1/11, 1½ 2/4; 15% allowance for old belts.  
**ECONOMIC** Tyre Co., 137a, Lewisham High Rd., New Cross. 'Phone: New Cross 1393. [2562]  
**TWO** 650x65 Dunlop Covers, heavy rubber-studded, quite new and perfect; accept 1 gn. each.—Ward, Shipton, Oxford. [X7323]  
**KEMPSTALL** Tyres for Cars and Motor Cycles; delivery from stock; trade supplied.—Depot for Kempshall tyres, 200, Deansgate, Manchester. [2431]  
**7/6** Allowance Guaranteed for old tyre towards nearly all new motor cycle covers.—Particulars to Taylors', Tyre Stockists, Store St., London, W.C. [0626]  
**26x2½** New Continental Cover, 12/6; ditto, heavier, 18/6; 26x2½ ditto, 15/-; ditto, heavier, 20/-; approval against remittance.—Palmer's Garage, Tooting. [2310]  
**MUST** sell at once, all brand new.—26x2 extra strong Wood-Milne cover, 36/-, accept 18/-; 26x2½ grooved Wood-Milne, 21/-; 26x2½ special heavy Bates, 20/-; 26x2½ Avon Stonehenge, 19/-.—Millards, Drapers, Chesterfield. [X8301]  
**EXCEPTIONAL** Offer for month only, in order to advertise British made motor tyres and belts, absolutely new, direct from works, with makers' guarantee. We will supply any size tyre or tube at reduced prices. Agents wanted for Kempall, the famous petrol substitute.—Kemp's Rubber Works, Hardman St., Manchester. [7527]  
**BUSINESSES AND PROPERTY FOR SALE, TO BE LET, OR WANTED.**  
**WANTED**, small motor or cycle business, or would manage same.—Pillfold, Greyhound Lane, Stratford, S.W. [2449]  
**LOST AND FOUND.**  
**5/-** Reward.—Lost, on Hastings Road, August 28th, Flimwell to London, bag and tools, etc.—W. Mack, 71, Listria Park, Stoke Newington, London, N. [2247]  
**PATENT AGENTS.**  
**INVENTORS** Advised Free.—King's Patent Agency, Ltd., 165, Queen Victoria St., London. [5818]  
**FLETCHER WILSON**, of Coventry, Chartered Patent Agent.—Registered United States Patent Attorney. [1664]  
**HENRY SKERRETT**, Chartered Patent Agent, 24, Temple Row, Birmingham.—Patents, trade marks, and designs. Motor patents a speciality. [0636]  
**SITUATIONS VACANT.**  
**WANTED**, motor and motor cycle mechanics; good jobs to right men. No person on Government work need apply.—Apply nearest Labour Exchange, quoting No. A1959. [0819]

## The Engine of the Future.

IT is a feather in the cap of the British motor cycle manufacturer that a leading American firm should have followed his lead and introduced for 1917 a type of motor cycle beloved by Britishers. We refer to the horizontally-opposed twin-cylinder, a type of engine which first appeared on a motor cycle as a marketable production so far back as 1904. Since that date motor cycles with "flat" engines have always been before the public, and it is a significant fact that each succeeding year this type of engine has gathered increasing support from manufacturers, whilst the importance of its achievements on road and track has likewise grown in corresponding ratio. To Mr. J. J. Barter, of Bristol, who first introduced his Fée motor cycle (later known as the Douglas) in 1904, a great deal of the credit is due, and there is no doubt that his missionary work accomplished in the face of immense difficulties has opened up a new field for motor cycle manufacturers, the significance and extent of which it is impossible to estimate at this moment. Of copies there have been many, but no one can be blamed for adopting a design which has been proved by exhaustive tests to be highly suitable for motor cycle work. It is no new suggestion of ours that the horizontally-opposed twin is the engine of the future. It has faults; for instance, the overall length does not lend itself to a neat frame construction, and the rear cylinder in particular is apt to be difficult to remove, but its even firing and almost perfect balance easily outweigh its disadvantages. Quite apart from the fact that there is a choice of half a dozen makes of horizontal twins whose names are well-known, we hear privately of others on the stocks which will be introduced after the war. Our remarks refer exclusively to the four-stroke type of engine, no manufacturer having yet got beyond the experimental stage with the two-stroke horizontal twin, but the return of peace will see important developments in this direction.

## Improved Petrol Position.

AT last daylight is seen in the petrol restrictions. Those sanguine users who expected more petrol to be available in the autumn—just at a period, as we have already pointed out, when motoring wanes until the succeeding spring!—will be gratified. In the words of the Petrol Committee, "The position is ever so much better, and we hope to be able to release much more petrol under the new licences when they have to be renewed next month for private motor cars and motor cycles. As soon as we are able to arrive at a definition respecting the new licences the fact will be duly announced." Readers who have husbanded their allotted amount of petrol, by the use of substitutes, can retain their licences until such time as their stated quantity has been exhausted, and those who have not bought their petrol can have the tax returned to them. Meanwhile, from Saturday next, an increase of petrol for commercial and certain professional purposes is promised.

There is no prospect of the Petrol Committee ceasing to exist, as until the Finance Act is amended the war tax of 6d. per gallon will have to be collected, and for that purpose petrol licences will continue to be issued.

At this juncture it would be interesting to know whether the petrol tax is yielding the huge amount it was estimated that the proposed motor car taxes would produce. We doubt it personally, though obviously we have no reliable figures to go upon. In any case if shortage there be, it is due directly to the lack of foresight in arranging sufficient quantities of petrol or checking reckless consumption of the precious spirit at a much earlier date. By sanctioning the use of more spirit, the Exchequer will benefit considerably, for every user of petrol must contribute 1s. tax for every gallon he "consumes," and that is why people who have never yet believed in a dire shortage of petrol were amazed at the meagre allotment.

# FLYING—A MOTOR CYCLIST'S IMPRESSIONS.

I HAD done a slight service for a pilot, and he asked me if I would come to look him up the following Monday, when he would take me on a test flight. Would I go? Would I not? And you may be sure I was round to look him up at the first opportunity.

The machine he was going up in was a —. Well, perhaps I had better not say what. It was fitted with an eight-cylinder engine V type in front, the observer's seat being immediately behind the engine and the pilot's seat behind that. There were numerous little odds and ends which I don't know the name of, and if I did it would, of course, be inadvisable to mention them.

## Sensations.

Taking my seat I watched the mechanics pull over the propeller. At last we were ready. "Contact," shouted the mechanic. "Contact," said the pilot, and with a sharper pull than the previous ones the engine started and the propeller vanished. Gee! what a draught. It compares well with going all out down a steep hill against a gale of wind. Distinctive engine noise vanished, and it became more like the drone of several Scott machines running together. Now the mechanics pull the chocks away from the wheels and we move, slowly at first. Soon the motion became like riding an Edmund spring frame machine over a field, with, of course, the difference that there was a tremendous wind when I put my head round the corner of a windscreen not much bigger than this page. We soon lost that sensation, and barring the fact that the ground seemed racing away at a tremendous speed we might have been in a motor cycle race held on a billiard table surface.

## Banking.

This was great; as yet we were only about 20ft. above the ground, and I was not at all prepared for the next surprise, for the pilot suddenly made the machine rise rapidly, and I felt as though my head was being forced into my body by a huge weight. The nearest I could describe the motion was as that of rushing down the straight at Brooklands and going straight up the test hill. Although the body felt like rising the head felt as if it was being forced down. On we went, and soon we were over a place which I had often wanted to see from above, and consequently I leant over to look at it. The pilot took advantage to "bank" in that direction, and for a bare fraction of a second I thought I was falling out. I had been caught napping, and he properly "shot the wind up me." I suppose it was retaliation for shooting it up him when I drove him on the motor cycle and sidecar. Anyway, it felt something like being on the carrier of a solo machine when you expect the rider to turn to the left and he turns to the right, only without being able to know where he is going.

"LITTLE JOHN"

The track of a motor cycle is limited to roads, but an aeroplane can turn anywhere any time. Sitting in front of the pilot the observer does not know when he is going to be suddenly put into a "horizontal position." As we turned I made one violent but unconscious grab for the opposite side, but there was no need. Before the banking was completed I saw a midget figure of a motor cyclist dashing along a road visible between the tips of the wings.

It must have been "some" bank, for in a second or possibly less we were facing in a direction which meant we had gone round at least 270°, or threequarters of a circle. We were now going over sandy country, and although I should judge that we were 1,000 feet up, the tracks of horse transport were clearly visible, showing that a convoy had passed, and in the distance was a cloud of dust which, if we had been reconnoitring, we should have had to investigate. Over in the distance I could recognise landmarks which told me we were at least four miles from our start, and then we turned for home. We swooped down to the sheds and then up again, apparently missing them by inches, but in reality it must have been hundreds of feet. We soared up, and then almost stopping the engine we seemed to come to rest.

## Landing.

Then down went the nose, and I felt like putting the brake on and switching off; but there is no brake and no switch, and so I resigned myself to banging into that patch of green. Whirr the engine went, and in a twinkling the earth disappeared and the sky was only visible. Again the revs. died down and we seemed to stop—we were stopped—I tried to balance—I felt as though I was on a nine inch plank balancing a heavy twin motor cycle which had come to rest. In a second I must fall. What was I to do. Whirr went the engine, and with a cross between a dive and a bank I found we were gliding gently over the shed rapidly coming down. Now for the bump I thought; but there was none perceptible: right across the aerodrome we went, gradually slackening speed until we automatically stopped, and then turning her round the pilot taxied the plane back again to the starting point. I thanked the pilot and looked at the watch. I had been up for ten minutes, and as near as I could reckon we had done ten miles.

I feel almost that I should like to fly, and yet when all is said and done I would prefer to trust myself to someone else, although on *terra firma* I certainly prefer to hold the controls of a motor cycle in my own hands.

We are informed that a kilometre hill-climb held in Denmark on September 24th was won by a rider mounted on a Harley-Davidson. The winner improved on the previous best timing by 4s.

## Occasional Comments

By Ixion

### From America.

American riders cannot yet have enjoyed much experience of baby two-strokes, but one of their manufacturers knows something. He advises users of what Yankees call the "gasoil" system to stop their engines after a run by turning off the petrol and letting the engine drain the carburetter, or they may have starting trouble next day from oil sludge choking up the fine passage leading to the jet.

### A Modern Surface Carburetter.

I have under test a carburetter which is really a combination of the old surface type and the modern spray pattern. It is known as the G.A.S.P., and is devoid of a jet in the usual sense of the word, the petrol being fed to a small pencil-shaped roll of wire gauze, placed in lieu of the jet in a carburetter which externally resembles the ordinary type. The main adjustment is performed by raising or lowering the gauze pencil, and so varying the amount of petrol-carrying surface exposed to the air. The vaporiser is controlled by a single lever, as it is arranged on straight-through principles, and the throttle piston is so shaped that the amount of the gauze exposed and the area of the air intake uncovered at any setting of the lever are in accurate relation to each other. In other words, it really amounts to a variable jet carburetter, combined with the main merit of the old surface type, viz., that there are no narrow passages which may choke if there is dirt in the spirit. What would not competition riders have given for an unchokable carburetter in the days of the old non-stop trials, when a momentary stoppage put us out for good and all. The vaporiser is thoroughly well-made, develops quite as much power as the standard type, registers a moderate consumption (neither very high nor very low), and is most reliable in use, whilst its single lever control will interest many riders. It should enjoy a good vogue when conditions return to the normal. Not the least of its merits is the simplicity of adjustment, it being possible to adjust the gauze (equivalent to trying a fresh size of jet on standard types) in half a minute by simply unfastening an external lock nut.

### The Power of a Single.

A correspondent considers that the multi-cylinder engine is damned because of its habit of giving up the ghost under hard work on top gear, and calling for a change down where a single will go on plugging away, but that if twins had a separate magneto and carburetter for each cylinder they might display the same rugged characteristics as a single. As a case in point he quotes a recent trip with his big single James and a Canoelet sidecar, the live load with luggage totalling about 28 stone. From Doncaster to Scotch Corner he struck a stiff head wind, but the James took its load up all the rises on top gear ( $4\frac{1}{2}$  to 1) at between fifteen and twenty miles an hour. This sort of performance he very rightly describes as typical of a good single-

cylinder, and as rather beyond the compass of a twin of the same c.c. He considers that comfort is dearly bought at the sacrifice of such potentialities, and questions whether my A.B.C. would equal the performance. It certainly would not. Under such a load I should change down, and, if I so desired, double his speed. To this alternative method the only objection is that in my correspondent's experience and opinion there would be a vast increase of vibration. I have not ridden the big single James, and so exclude it from my reference; but a first-rate horizontal twin of 4 h.p. causes less engine vibration at 20 m.p.h. on an intermediate gear than the best singles I know do at the same speed on top gear. Being familiar with both types, I should infinitely prefer to ride the twin and to change down than to drive a single and remain on top.

### More Judicial.

Dr. Lindsay, the Norton enthusiast, writes from France in a more judicial vein. He frankly admits the broad desirability of pushing designs which reduce engine and road vibration; and interprets his *penchant* for the flying singles as based on the twin desires for extreme speed and extreme reliability. Of course, the days are coming when we shall get vibrationless engines and spring frames in conjunction with the speed, power maintenance, and reliability of the best class singles. For the moment it is true, on the one hand, that the single-cylinder is the more durable engine; that it maintains its power better; that it is—on the whole—speedier. It is equally true that it is grossly uncomfortable.

### About Sparking Plugs.

Dr. Lindsay further points out that in the first article he ever wrote for *The Motor Cycle* he underlined the tendency of many sparking plugs to pre-ignite in super-efficient engines. He still pins his faith to the single-point Bosch plug, and by strenuous research in out-of-the-way garages he has maintained a stock of half a dozen or so. He further ingeniously increases his supply by buying up sound multiple point Bosch plugs, and substituting the central electrode from a single-point which has "gone phut." He finds that a quarter of a mile at 45 m.p.h. in a Brooklands Norton renders many British plugs incandescent, though a Blumel and an Ajax behave tolerably well. Another correspondent denounces me for praising German stuff. This is stark folly. We cannot win a world trade by shutting our eyes to facts and pretending that we are top dogs where we are not. Let us all frankly criticise British goods, British methods, and British policy wherever we find a fault until British stuff is uniformly the best. One candid friend is worth a hundred lying toadies any day; and, candidly, some British plugs will stand a lot of improving even yet. I must, however, add the Lodge racer to my list of reliable high-speed plugs; it is, to my thinking, just about as good as the Bosch single-point in most respects except price.

# A RESTFUL HOME FOR WAR WORKERS.

## OPEN AIR LIFE BY THE RIVER AVON.

**F**OR many months past war workers, both male and female, have been working at high pressure, and nothing is so conducive to keeping in perfect health in mind and body as a complete rest when the long day's toil is over. The first necessity for restful repose is a complete change of surroundings. In many districts this, unfortunately, is impossible, and all that the worker can do is to retire from the factory or office to the home in close proximity, and either spend an hour or two at a picture house or other place of entertainment or retire to bed. In some districts, particularly in the Midlands, more ideal circumstances prevail, and those possessing motor bicycles or other quick means of locomotion may run into the country and enjoy that fresh air which is unattainable in the hives of industry.

Some war workers in the Midlands this year hit upon a most happy idea in keeping themselves in the best possible condition physically for carrying out the heavy work which they had undertaken and of also enjoying the beauties of an English summer.

### A New Use for a Cricket Pavilion.

In the happy pre-war days they had watched, on an excellent cricket field bordered by the classic Avon, matches between picked teams of the district, and had enjoyed teas in the excellent and commodious pavilion. Since August, 1914, the clubhouse has been empty, and the field, once one of the best in the county, now resembles an ordinary pasture meadow. Most of the players have joined the Forces, and are either in training in England or fighting for their

(Right) Speeding the parting guests—leaving the rest home for town life.

**A Restful Home for War Workers.—**

King and country over the seas. Why could not the pavilion be made a summer residence for war workers? thought one of them, and quickly the idea materialised. The cricket club authorities were only too ready to augment their finances, which had suffered, by letting the house at a reasonable rent, and early in July a party of ardent workers took up their residence there.

The dressing rooms made excellent bedrooms, while the large room was available for meals (when the weather was unfavourable), for the storage of various necessities, and when increased sleeping accommodation was needed. Nearly all the meals were served on the extensive verandah, and, with the exception of sleeping, the whole party lived in the open air. All the cooking was done over an open wood fire, and those unaccustomed to camp life would be astonished at the excellence and the variety of the meals served. "Early to bed and early to rise" was the invariable rule. Boys and girls came to the bungalow tired after a heavy day's work, but a swim in the river and an appetising meal put them into the best of humour, and after an hour or so lazily pulling in the boat they were ready for bed. An early morning start presented no difficulties to the manager of the commissariat. A hot breakfast was always ready, and the workers set out on their short journey well equipped for the day's toil. Saturday afternoons and Sundays were the great days at the bungalow. Then visitors from a greater distance were welcomed, and frequently owners of sidecar outfits were to be seen making their way across the field to the pavilion. Bathing, boating, lazing, and talking were the order of the day.

**A Useful Machine.**

One of the tenants was the fortunate possessor of a 6 h.p. combination, and with this reliable machine

he was able to come "home" more frequently than others, and with such a powerful engine, too, he was in a position to be of assistance in carrying the necessities from the nearest town to the pavilion, so our photographs show this vehicle in active service. When the supply of petrol to motor cyclists was reduced to the absurd minimum of half a gallon a week, it was feared that the services of this machine would be lost, and that the visits of its owner would be considerably curtailed, but he thought otherwise. He constructed an auxiliary tank out of an old oil-can, in which he carried petrol, and he filled his tank with paraffin. Starting up from his auxiliary tank, he switched on the paraffin, and the engine when once warm ran magnificently on the crude spirit. As the mornings grew colder he had some difficulty in starting, but with a little help this was soon overcome. He subsequently tried other substitutes, and good results were obtained from Wital fuel, Petrofin, Petrolior, and Beatsol, which he obtained at various prices.

**Stabling Accommodation.**

Among the week-end visitors to the "Home of Rest" were owners of large touring cars and light cars. Accommodation for these larger vehicles pre-

**SCENES OF THE ADVENTURES OF ROBIN HOOD AND LITTLE JOHN.**

sented greater difficulties than that of motor cycles with or without sidecars, which could be pushed underneath the pavilion. With the shorter evenings in September and the restricted lighting regulations the tenancy of the bungalow had to be given up with the greatest regret, but with the firm determination that should, unhappily, cricket be impossible next year a still more lengthy stay will be made on the banks of the Avon by those who this year have so greatly benefited by their sojourn there.

### A Further Selection of Letters from Readers scattered all over the World.

**W**E continue our efforts to popularise motor cycles the world over by quoting extracts from our Overseas mail bearing upon different aspects of the motor cycle movement. As usual, there are many complaints with regard to the prices, etc., of British mounts, while several correspondents are championing their favourite Yankee mounts. One or two letters contain interesting items with regard to riding experiences abroad, interesting to both readers at home or in the Dominions. Of course, considering the state that the motor trade in this country is in at the present time it is hardly fair for our overseas cousins to be too critical. So far as obtaining delivery of new machines, in many cases they are better off than we ourselves here in England. In visiting various motor factories we continually hear the statement that they are only producing a few machines, and all of those are destined for overseas. In discussing the British *v.* American motor cycle problem for overseas use our overseas contemporary, *Motor Cycling of Australia*, makes the following interesting statement which helps to bear out the remarks made by some of our correspondents:

"In the interests of British motor manufacturers it is most desirable that they should fully realise the great strides American builders have made. The tendency has been to under-rate American competition, and British manufacturers have frequently ignored warnings from their own representatives.

"British manufacturers should not ignore opinions expressed in the Dominions, because if we do not build here we are certainly in an excellent position to test machines under conditions that do not exist in England, and of which the manufacturer is ignorant. American road conditions are mostly similar to ours in Australia, and the Colonies possess good testing grounds from which to obtain data further to improve machines, particularly as regards springing methods and frame construction."

On this very subject of British motor cycles and manufacturers' methods, we are reminded that a letter was received the other day from a Spanish writer which exposes the indifference of some British manufacturers to the foreign market. Before the war we frequently heard that cry, and it is only natural that at the present time it should be

accentuated. The man who wished to purchase a British motor cycle was a Spanish doctor, and knowing the few Englishmen in this settlement asked them to obtain the price of a machine shipped and insured to any Spanish port. The reply they received was curt and to the effect that "our prices are such-and-such, at our works." Delivery date is not mentioned.

We are well aware of the position of the British makers to-day, but even so, a letter explaining fully the situation would have been better than a letter which said in effect, if not in words, "We don't particularly want your business, will you kindly refrain from worrying us."

The writer goes on to say that these actions will be remembered, and that buyers will act accordingly after the war. Although the above case is not exceptional we must, in justice to British manufacturers, point out that it is not usual treatment to expect from English makers. The Overseas Supplement to *The Motor Cycle* gives the lie to a sweeping assertion that British makers are not courteous in replying to enquiries, and that they are indifferent to the foreign market.

#### Long Distance Trips.

MR. H. VIEUSSEUX, Campsie, Australia, writes: "My last machine was a  $3\frac{1}{2}$  h.p. Zenith. I found it a most excellent machine. I think, without a doubt, the roads out here are the worst in the world.

"I used my machine for four months in the summer when it was 100°-108° in the shade. My trips were from Sydney to Geelong—215 miles. This trip I did twice a week, and in the four months the engine was only taken down twice for cleaning. *Re* ground clearance, I would favour five inches."

#### Foot Horns and Indians in the Colonies.

"CEYLON No. 2," Kandy, Ceylon: "In your issue of May 18th I notice a letter from 'Ceylon' on the above subjects. The writer wants a foot-operated horn because it is dangerous to pass bullock carts and passengers or take hairpins with one hand off the handle-bars. But who on earth does such a thing? I have been riding out here for several years, and the invariable custom is to sound the horn well before approaching a cart or human beings, or before taking the hairpin, and then to crawl past or round with both hands on. The man who comes level with a cart before he has a clear way and can keep both hands on is asking for trouble. A curious thing is that often a native's skull is too thick to be penetrated by the sound of *any* horn, but the human voice gets there every time.

"Ceylon' has had three nasty spills—twice through sandy soil and once through a coconut. I would suggest that had he had both hands on the handle-bars it would

## Overseas Opinions.—

have made little or no difference. I have been there myself. As for barging into natives, I have done that, too. But in each case I had sounded the horn *previously* (no effect), and had then yelled—with both hands on the bars. I did 'wake the beggars up with a nasty jar,' and stuck on. I have been clean over dogs, goats, hens, snakes, scorpions, and young pigs, and they have never yet caused a fall. (I touch wood humbly.) I have done many thousands of miles through villages and along the most mountainous tracks in Ceylon, and have had more than one fall, but I can honestly say it has never been the fault of the horn on the bar. If 'Ceylon' will clear the road *in front of him*, use his voice occasionally, and drop his feet when going round hairpins or over sand or loose metal I think he will be content to leave the horn where it is.

"I heartily agree that 'it is far easier riding in London than out here.' I remember some years ago taking a newly delivered machine through Town without stopping the engine, but it was child's play compared with *our* work.

"I must, however, dissent from 'Ceylon' on the question of Indians. It is true they find a ready market, since they are cheap, delivery during war time is practically certain, and spares can always be got through. None of these conditions apply to English machines. Of the eighteen Indians recently imported I believe a good proportion were 5 h.p. models, and, therefore, not rear sprung, so the contention that the rear springs brought customers is scarcely tenable. I would also query the statement that 'there are plenty of English solid framed bicycles for sale.' I have reason to know, as I hunted in Colombo for months. Apart from a few B.S.A.'s and Blackburnes, there has been practically nothing imported from England for over a year. I think most of us would agree that if we could get an A.B.C., A.J.S., Clyno, Douglas, James, P. and M., Rover, Rudge, Scott, Triumph, or other such make we would, *but we cannot*. I got an English 3½ h.p. horizontal twin which happened to blow into Colombo, and after it had done its first 1,000 miles a planter offered its original price at sight!

"Honour to whom honour is due, but hats off first of all to Old England."

## Another Plea for Spring Frames.

MR. W. PEIR, Sydney, N.S.W.: "I hope that you will not let the rear springing agitation drop until it is an accomplished fact on practically all motor cycles. Greater attention to details such as mudguards, better clearance, and hinged to facilitate wheel removal, are points requiring attention. I hope also you will use your influence towards getting us better equipped machines. I daresay it is too early to expect a few vital spares, but surely every machine should have at least a horn and lamp. Cylinder removal without taking the engine out of the frame is important, and it is a pity that the opposed cylinder type really necessitates engine removal to decarbonise."

## American Lightweightes.

MR. ELLIOTT B. HOLTON, Secretary N.J.M.C., New Jersey, U.S.A.: "Just in from an observed lightweight run of 180 miles, in which the Cleveland and Indian featherweight came through with flying colours.

"The average pace was to be 20 m.p.h., but the two men—Waghorn on the Cleveland and Robertson on the Indian—frequently ran into sight of the checks a quarter to half an hour early. One stretch of thirty-five miles they rolled off in 71m., which is good considering that seventeen of it was within the city limits of Philadelphia.

"The net results of the test are that anyone can rely on a two-stroke machine for a real honest-to-goodness trip, something the people over here have been doubtful of since the introduction of the lightweight last October.

"The fuel consumption was: Indian, 71.36 m.p.g.; the Cleveland \*77.17 m.p.g., including the 12 to 1 mixture of oil. Our gallon is 46 cu. in. short of your Imperial gallon, so that the comparison is not bad, all things considered. Had there been need, penalisation for loose or broken parts would have been made, using the Scottish Six Days Trials ruling.

"My idea of the individual work of each machine is that the Cleveland, with a B. and B. carburetter, two-strokes more steadily, but is not as quick to answer the throttle or as good a hill-climber as the Amac equipped Indian, whose worst fault is to four-stroke at times."

[\*92.1 miles per Imperial gallon.—Ed.]

## Automatic Carburetters.

MR. J. M. SMITH, Bloemfontein, South Africa: "I have used and had to do with most makes of automatic and semi-automatic carburetters, and am of the opinion (gathered during the last eleven years) that the carburetter with two levers—air and gas—is, especially in this country (South Africa), by far the most economical and satisfactory.

"I do not consider that it is within the power of any human being to construct an automatic carburetter that is quite satisfactory at all speeds of the engine, and more especially at all temperatures. When the thermometer registers between 90° and 100° F. it is, to my mind, obvious that the petrol vaporises much more readily than where the temperature is about 30° to 50°, and in the former case, the air being much more rarefied, a larger bulk is required to dilute the mixture, and it follows that the adjustment for, say, 60° cannot, I should think, be equal to dealing with the higher temperature.

"I have had automatic and semi-automatic carburetters fitted to some of the machines I have possessed, but nowadays I have no time for anything but the two-lever variety. If I am wrong I am open to conviction. There is no doubt the automatic is handier, but! I also find the automatic consumes much more petrol, yet it seems to me that I faintly remember that 'Ixion' used to be a constant supporter of the automatic variety. He has had a great deal more experience than I, and yet I am really pleased to see that he seems to be coming round to my opinion.

"I may say that my experience is not confined to South Africa, as I have also owned and ridden motor cycles in Scotland."

## Mysterious Pulling-up.

MR. J. A. MACGILL, Bangkok, Siam: "With reference to 'H.L.C.M.'s' question on page 438 of your issue of May 4th, if his carburetter is a B. and B., old type, I would suggest a further close examination of it for the following reason. I once experienced the same trouble with a 3½ h.p. three-speeder, having a B. and B. carburetter, the needle of which had been made, or had become, shorter than standard. The lid of the float chamber had, fixed to its inner face, the usual block carrying the balance-weight mechanism, etc., and the top end of the needle passed through a hole in the block up into a dome, which was screwed into the lid from outside. The internal diameter of the dome being less than the diameter of the hole in the block, a distinct 'step' was formed. When the carburetter got tilted the petrol in the float chamber, obeying the natural law of levels, forced the float (and with it, of course, the needle, owing to some play at the collar) to maintain the vertical position. The result was that the stub end of the needle got jammed into the 'step,' thus preventing the needle from rising smartly off its seat to admit fresh spirit. When the 'step' was bevelled off, and the needle given a chance of *sliding* up into the dome, the trouble disappeared. I have noticed in your columns several complaints of 'drying-up,' to which the above diagnosis might be applied."

A COLONIAL'S  
SIDECAR-DRIVEN  
OUTFIT.

## A HORIZONTAL TWIN INDIAN.

An Entirely New 2½ h.p. 257 c.c. Opposed Twin Lightweight included in the Indian range for 1917.

5 h.p. and 7 h.p. Twins retained, all with Three-speed Gears.

REAL novelty in design is necessarily restricted in this country by reason of the war. Clever designs, such as the Scott Sociable exclusively described in *The Motor Cycle*, do not grow on hedges. One of the few entirely new productions to make their bow to the public since the fateful days of August, 1914, is the 2½ h.p. horizontally-opposed twin-cylinder engine which is announced as a leading line of next year's Indian range. Since the Indian branch was opened in this country in 1909, motor cycles bearing this name have, by reason of their essentially practical design and first-class materials, assumed growing importance. Year after year the Hendee Manufacturing Co. has introduced some new model, or embodied some strikingly attractive feature in its existing models, with the result that the Indian hold on the public is a strong one. Indian practice is frequently indicative of future American trend of design, and it is no bold forecast to state that the Indian lead is bound to be followed in America by other motor cycle manufacturers before many months pass. In England the horizontal twin has always constituted a warm favourite. The world-wide popularity of the Douglas machine ever since its inception is proof of the winning ways of this type of engine.

For 1917 three distinct types of machines will represent the Indian factory,

### THE NEW INDIAN PRODUCTION.

A horizontal twin-cylinder "lightweight." The cylinder dimensions are 50.8 × 63.5 mm. = 257 c.c.

viz., (1) the 2½ h.p. 257 c.c. "flat" twin, (2) the 5 h.p. V-type twin, and (3) the 7.9 h.p. V-type Powerplus. As will be seen from the undermentioned details, the horizontal twin is the real novelty. Its design does not follow accepted practice, but quite a number of important features are incorporated, some of which are immensely practical.

#### Details of the "Flat" Engine.

Probably the most striking feature of the latest production is the compact appearance of the power and transmission units, which are carried unusually low down in a cradle, or loop, frame. It will cause disappointment to many to learn that the capacity of the engine is but 257 c.c., giving a rating of 2½ h.p. The bore and stroke are 50.8 and 63.5 mm. The length of the stroke is noteworthy, as the flat engine has hitherto been arranged with approximately square dimensions, and it should be interesting to see how in practice the long stroke compares with the short. The cylinders are cast in one piece, and have the

valves arranged side by side, and placed in an almost horizontal position on top of the engine, metal covers being fitted over the springs and tappets, so giving a neat appearance.

The timing gear is situated in a separate timing case cast alongside the main crank chamber. The cams, however, are in the main case, where they receive a liberal supply of oil splashed by a 180° solid crankshaft. The connecting rod big end bearings are split, and are, therefore, easily taken up when wear occurs. Contrary to usual Indian practice, a hand pump is solely relied upon for supplying lubricant to the engine. The lubrication of the front cylinder, however, which is a most important point on horizontal twins, has received special attention, as in addition to the ordinary splash caused by the connecting rods dipping in the oil in the sump, an ample supply of lubricant to this cylinder is ensured by means of a hole drilled longitudinally through the cylinder wall. This hole leads to the piston from a trough situated in such a position in the crank case that it is continually kept full of oil.

A small glass window is fitted in the sump, through which the height of the oil can be ascertained. The sparking plugs are arranged in the uppermost part of the cylinder head, just above the inlet valves, and should therefore keep as free as possible from oil. The magneto, which is a special type of fixed ignition Dixie, is mounted on the flat top of the case. A feature of the magneto is that it is driven at engine-shaft speed, having a special outside distributor arranged on the right-hand side to direct the high-tension current alternately to each cylinder. The higher speed at which the magneto is run should greatly facilitate starting. Running lengthways immediately beneath the engine a large cylindrical silencer is fitted, having a rear extension outlet pipe.

#### A Three-speed Gear.

Immediately behind the silencer and just beneath the rear cylinder is situated the gear box, which is of the three-speed

Sectional view of the new "flat" twin Indian engine.

# ALWAYS ON GUARD

The clever and practical design of the **CLINCHER DE LUXE** tough white tread guards you against side-slip perils and tyre troubles.

This change in guard from the rider to the tyre will be greatly appreciated by all Motor Cyclists, seeing that it relieves them of all nerve strain when meeting treacherous surfaces. Be on your guard against substitutes, and insist upon having

instead of experimenting now (at your own expense) with unreliable, untried, unknown substitutes. The after-the-war SturmeY-Archer will be well worth waiting for.

STURMEY-ARCHER GEARS,  
LIMITED, NOTTINGHAM.

**A Horizontal Twin Indian.—**

New strengthened fork and head lug of the 1917 Powerplus.

pattern, and incorporates a Raybestos-lined plate clutch. The gear is operated by a quadrant lever on the side of the tank, while the clutch is actuated by a pedal on the left footboard. The usual Indian kick-starting device is also incorporated.  $\frac{7}{8}$  in.  $\times$   $\frac{1}{2}$  in. pitch chains transmit the power, both being protected by chain guards only.

The bicycle portions are very similar to previous Indian models, except that the front down tube is divided into two, thus forming very neat hangers for the horizontal engine. Front spring forks, exactly similar to those fitted to the two-stroke lightweight Indian and on the early model 5 h.p. V twin Indians, are used. The action of these forks is somewhat similar to the famous Triumph front fork. The springs are encased and situated beneath the steering head, while the fork blade is hinged about a quarter of the way down. Girders are not considered necessary, we are told, owing to the lightness of the machine. A most neat and compact appearance has been obtained by placing engine, silencer, and gear within the main frame, enabling the rear stays to be brought up close, so giving a delightfully short wheelbase, a somewhat unusual thing when the horizontal type of engine is fitted.

**The Controls.**

Curiously enough, the Indian twist grip system is not used, but undoubtedly the control is as simple as possible. The automatic one lever carburetter is controlled by an orthodox handle-bar control. No control is needed for the ignition, owing to its being of the fixed type, and no valve lifter mechanism is fitted, as starting the tiny engine by means of the kick starter is said to be so easy that such a fitting has not been considered necessary. A switch on the bars is the only other engine control fitted, but there is a hand-controlled rear brake, in addition to that operated by foot.

**Powerplus Improvements.**

The Powerplus model, which was introduced for the first time about twelve months ago, and which has proved itself such a splendid sidecar machine, has received a considerable number of detail alterations, the most noticeable of which are undoubtedly the strengthened steering head, front fork, and the new pattern tank. The front forks are now continued right up to the top of the steering head, where they are connected by means of a heavy drop forged plate, which also forms the lugs which hold the handle-bars. These can be swivelled up and down to obtain a variety of positions to suit each individual rider. The steering head, too, has been greatly strengthened by means of webbing, and incorporates a lug to retain the sidecar fitting. The appearance of the latest tank is considerably improved. It is of the pannier type, and is flush at the top, the top tube of the frame running through the centre; thus crevices, where otherwise the dirt could collect, are absent. The tank, being divided into two, necessitates two fillers and two petrol pipes, which arrangement will undoubtedly come in useful when petrol substitutes are used. The capacity of the twin tanks is larger than formerly.

An entirely new type of change-speed mechanism is another improvement, the operating lever being in a horizontal position, and working in a quadrant fitted nearly vertically at the side of the tank, the action being in an up and down direction, which is claimed to give a more natural movement. Only one rod is necessary to transmit this movement to the operating lever on the gear box, so that there is no lost motion due to wear, which commonly occurs where complicated bell cranks have to be used.

**Longer Pistons.**

A few small alterations have been made to the engine, the pistons and cylinders having been made a quarter of an inch longer, so giving increased bearing surface, while the gudgeon pin has been placed in a lower position in the piston, being now below the centre.

New horizontal twin-cylinder Indian power unit, showing kick-starter and divided front down tube. The three-speed gear box is directly beneath the back cylinder.

This, it is claimed, reduces the tendency to rock and cause piston rattle. The engine measurements are 79.375  $\times$  100.806 mm., which give a capacity of 997 c.c., and it will be noticed that a long stroke is also used in this model. A roller bearing is employed on the drive side of the crank case, as it has been found perfectly satisfactory in the previous model. Apart from these items the machine remains practically the same as

Indian divided flush top tank. There are two separate compartments, each with its own filler.

New vertical change-speed quadrant on the Powerplus Indian. The lever on the right is for the clutch.

the first model Powerplus, the appreciated rear sprung frame, mechanical lubrication, the cradle spring fork, and the 28 in.  $\times$  3 in. wheels remaining unaltered. The well-known Indian red enamel is still retained, with the addition of a broad black line on all flat surfaces.

Other 1917 Indian models, which show detail alterations only. (Left) The 7 h.p. Powerplus, which made its first appearance twelve months ago, and the 5 h.p. with rigid frame.

#### The 5 h.p. Model.

To those desiring a moderately light fast solo machine, the 5 h.p. V twin will undoubtedly appeal, it being ample for any solo work, and also being sufficiently powerful to take a light sidecar when required. This model has the old pattern

engine, viz., that fitted with detachable cylinder heads and overhead inlet valves. The frame is the ordinary rigid type, having only the Indian cradle spring fork in front. A three-speed gear and usual Raybestos-lined plate clutch is also incorporated as in previous models. All models have the frame strengthened by

means of liners, as has been usual in Indian practice for some years, while both the Powerplus and the 5 h.p. models still incorporate the Indian twist grip control for throttle, spark, and valve lifter. In other words, the small twin remains practically unaltered from last season.

## THE NEW ARMOURD CARS.

### FURTHER EXPLOITS OF THE "TANKS."

WE notice in the press fresh statements regarding the origin and construction of the new armoured cars, in spite of the Ministry of Munitions's exhortation of last week. We can state that most are imaginary.

#### The Armoured Cars Again.

A correspondent at British Headquarters in France tells of a British soldier on a stretcher, alongside a German soldier, on the way back from Gueudecourt, where "tanks" had figured. The German could speak English, and Tommy was saying to him, "Well, we've got your Gueudecourt."

"Yes," answered the Boche, "but you had to come in a taxi to take it."

#### Tommy's Taxi.

"There is not much that is mysterious in their construction, for they are just an improvement on the 'caterpillar' hauler or mechanical centipede that first made its *début* ten years ago before the military critics in Great Britain. During the present campaign 'caterpillars' have hauled the big guns of both sides to their positions. England has only further improved the speed and mobility of such machines, while rendering them bullet-proof. They are a further proof that England's craftsmen are still the 'handy jacks' of yore in this engineers' war of ruthless destruction."—*Daily Telegraph*.

#### "Pigs."

"In one club a few eager theorists fell to sketching their conceptions of the monsters. The drawings were ingeniously submitted to a taciturn and secretive fellow clubman who, by virtue of his connection with the Ministry of Munitions, is supposed to be 'in the know.' 'You can at least tell us which of us has got nearest to the real thing,' sug-

gested one of the theorists. The man in the know took up the sketches and examined them with interest. 'By Jove!' he said warmly, 'I haven't played this game since I was a kiddie.' 'What game?' asked one of the theorists. 'Drawing pigs with the eyes bandaged,' said the man in the know as he strolled away."—*Daily Mail*.

#### Official Despatch.

The despatch issued from British General Headquarters at 10.15 p.m. on Sunday last in connection with the severe fighting near Thiepval states: "In this action the new armoured cars have done valuable work in clearing enemy trenches behind the infantry advance."

#### German Terror.

*The Times* on Friday last again referred to the work of the heavy armoured cars in the following graphic description of one which had penetrated too far into the enemy's lines.

#### A Great Fight.

"When the village of Fliers was cleared the 'Tank' seems to have had a most extraordinary experience. Its skipper and its crew apparently grew bored with sitting still while other men were fighting; so Leviathan went on alone into the wilds beyond, to see what it could find. It found occupation enough. Some distance beyond the village, when it was surrounded by the enemy, something went wrong with its insides and it could not move. The enemy, discovering this, grew bold, and, creeping up to it, under cover of trenches and shell-holes, they fairly swarmed all over the poor thing, like the Lilliputians on Gulliver. They peppered it with bombs, shot through the crevices in its hide, and, so it is said, actually climbed on top of it.

"Meanwhile our infantry had cleared the village and they also wanted more to do. Then they discovered the plight that the 'Tank' was in, fighting like a buffalo ringed round with wolves. So they went to its rescue, and there seems to have been some fighting of the best, and when the enemy had been driven off he left between 250 and 300 dead on the ground around the 'Tank.' Behemoth himself was not seriously hurt, but was scarred like a bear that has been worried by terriers. The derangement of his interior has been repaired, and he is full of fight again.

#### Goliath.

"When the 'Tank' went off on this excursion on its own account the Germans from one of the nearer trenches, after Goliath had passed, came running back to the British lines to surrender in sheer terror, and an airman who was flying overhead gives an absurd description of the 'Tank' marching majestically across country, its progress marked by an effluence of white handkerchiefs and similar emblems of surrender waved from the trenches. Unfortunately, a 'Tank's' capacity for carrying prisoners is limited, and when the monster was seen to be in difficulties the enemy who had given themselves up changed their minds and fell upon it, with the results that have been told.

#### Lost Tank Regained.

"An incidental advantage of the taking of Gueudecourt is that the 'Tank' which was left crippled and deserted out ahead of our ultimate lines on the day when the new engines were first used and has lain there ever since, a landmark to both sides, has finally passed into our possession again. Rarely was a great success more cheaply won."

## A MOTOR CYCLIST V.C.

SEC.-LT. EDWARD FELIX BAXTER, late Liverpool R.

"Prior to a raid on the hostile line he was engaged during two nights in cutting wire close to the enemy's trenches. The enemy could be heard on the other side of the parapet. Sec.-Lt. Baxter, while assisting in the wire cutting, held a bomb in his hand with the pin withdrawn ready to throw." On one occasion the bomb slipped and fell to the ground, but he instantly picked it up, unscrewed the base plug, and took out the detonator, which he smothered in the ground, thereby preventing the alarm being given, and undoubtedly saving many casualties. Later, he led the left storming party with the greatest gallantry, and was the first man into the trench, shooting the sentry with his revolver. He then assisted to bomb dug-outs, and finally climbed out of the trench and assisted the last man over the parapet. After this he was not seen again, though search parties went out at once to look for him. There seems no doubt that he lost his life in his great devotion to duty."

The above is the official description of the gallant act for which a former well-

The late Sec.-Lt. E. F. Baxter, V.C., as a civilian in a pre-war competition, a despatch rider in the early days of the war, and as an officer in the Liverpool Regiment. In the left-hand view he is seen with his wife, who was as enthusiastic a motor cyclist almost as her husband.

known motor cyclist has been awarded the Victoria Cross.

### A Family of Motor Cyclists.

Many readers recognised in the list of V.C. awards published in the daily press last week the name of Sec.-Lt. E. F. Baxter as the Liverpool motor cyclist who in the far-away days before the war was an enthusiastic racing man and trials rider.

Edward Felix Baxter was the second son of Mr. C. Baxter, of Kidderminster, and was thirty years of age. He took up his residence in Liverpool about

twelve years ago, and at the outbreak of war occupied the position of chief commercial master at Skerry's College. To our readers, however, he was known as a very prominent North of England motor cyclist, and in many trials his wife and sister, both keen motor cyclists, also competed with him. His favourite machine was a Rex, and both in track racing and road trials he scored many successes.

When war broke out Baxter enlisted as a despatch rider, but had to be content with home defence work. This did not suit a man of his temperament, and in 1915 he obtained a commission in a Territorial battalion of the Liverpool Regt.

Last May we published the news that Sec.-Lt. Baxter was

missing, and now we have confirmation of that gallant deed in which it is presumed he lost his life. Thus one more name is added to the growing Roll of Honour of motor cyclists who have died for King and country.

Our readers will join us in extending sincere sympathy to his wife and sister, who in spite of their sorrow must feel pride in their hero.

Baxter was a prominent member of both the Mersey M.C. and the Liverpool A.C., and it is proposed to set up some form of permanent memorial in his honour.

## AN ITALIAN HOME-BUILT MACHINE.

WE have received particulars of a motor cycle built by two keen Italian riders. The component parts are almost all of British manufacture, and the design generally closely follows British practice. The engine is a small twin-cylinder J.A.P., and it is fitted with a Splittdorf magneto and a Senspray carburetter. The specification also includes three-speed gear and kick starter, chain and belt transmission. Saxon forks, and X.L.All saddle. Extra wide mudguards have been adopted, with a good tyre clearance. The power unit and gear box appear to us to be built very low in the frame, giving very little ground clearance, but, generally speaking, the machine has a decidedly pleasing appearance. It is always interesting to hear of enthusiasm which leads to such practical results as we here describe and illustrate.

A motor cycle built entirely of British components by two Italian readers. At first glance it might easily be taken for an English manufacturer's product.

# THE GRAND PRIX MORGAN FOR 1917.

10 h.p. Air-cooled M.A.G. Engine and Lengthened Chassis.

The 1917 Morgan Grand Prix runabout, which has a 10 h.p. air-cooled engine of 1,093 c.c. capacity, a lengthened wheelbase, but is in other respects practically unaltered.

**T**HOUGH few motor manufacturers are able to devote attention to new productions, there are others in a more favourable position able to build up machines in a quiet way. The Morgan Motor Co., Ltd., Malvern, is one of these concerns, and the firm in question has recently finished its 1917 Grand Prix runabout. This machine is, to all intents and purposes, an amalgamation of last year's touring and Grand Prix types. The new model has a lengthened wheelbase—the result of racing experience—which is found to give more comfortable riding and the greatest stability on corners. Usually Grand Prix Morgans have had water-cooled engines, this type being favoured, as it enabled more sustained speed than the air-cooled engines used hitherto. It is therefore a departure for the firm to adopt as standard an air-cooled engine on the 1917 model.

The engine in question is a 10 h.p. M.A.G., the famous Swiss production which, in different sizes, is already largely used on motor cycles and appreciated by users. The 10 h.p. model fitted to the Morgan is of an unusual size, the dimensions being  $82 \times 103.5$  mm., and the capacity 1,093 c.c. Though of a new size, in general, the design follows M.A.G. practice, having enclosed inlet valves, with the operating mechanism lubricated from the crank case. The vehicle illustrated is shown with its equipment complete, including hood, screen, and acetylene lamp set. The appearance, save for its increased length, remains unchanged, and the chassis itself has undergone no important change for 1917.

sions being  $82 \times 103.5$  mm., and the capacity 1,093 c.c. Though of a new size, in general, the design follows M.A.G. practice, having enclosed inlet valves, with the operating mechanism lubricated from the crank case. The vehicle illustrated is shown with its equipment complete, including hood, screen, and acetylene lamp set. The appearance, save for its increased length, remains unchanged, and the chassis itself has undergone no important change for 1917.

## Petrol Committee's Latest Announcement.

**A**FTER the leading article in this issue had gone to press, mentioning that an increased allowance of motor spirit for commercial and certain professional purposes had been decided upon, a further announcement was made that this new scheme would not come into force until November 1st, but notices from the Petrol Committee giving particulars as to forms of application under the new licences will be issued on October 7th.

New licences for the purchase of motor spirit for use in private motor cycles will be issued this month to holders of licences which expire in that month. The licences will cover the period November to March inclusive. Application must be made on the form attached to the present licence, and sent to the Petrol Committee not before October 9th. Owners of motor cycles can obtain a licence for two or four gallons per month by remitting 5s. or 10s. with their application for ten or twenty gallons at 6d. per gallon.

Owners of motor cycles who on account of special services hold licences for more than four gallons per month should apply in the first month for the amount entered on their present licences, and should remit the duty payable at 6d. per gallon for a five months' supply.

The Triumph Cycle Co., Ltd., find that, owing to Government work, they are quite unable to undertake at present any repair work. Private owners desirous of having machines overhauled or repaired are therefore advised to approach local agents.

## TWO NEW SADDLES.

**T**HERE seems to be a tendency to mount the peak of a motor cycle saddle on the top tube, and we illustrate two new inventions designed on this principle. The first is the patent of J. Aller, of Hellerup, near Copenhagen, and is very simple in design, as will be seen from the illustration. The front is supported on a flat spring, pivoted above the top tube by means of vertical links, while the rear part is carried on helical springs in tension. This arrangement

The Aller saddle—a Danish invention.

allows of a swinging backward and forward movement, as well as the usual rise and fall, which should make for easy riding.

The second invention, which is the new Indian saddle, is much more elaborate. A seat supporting frame is provided, on which the seat is pivoted at its front end and supported at the rear by compression and tension springs, which permit the saddle to yield to the weight of the rider. This frame is in turn spring supported at three points on the cycle frame: in the rear by two helical springs in tension, attached to a T piece extension of the top tube, and in the front by a leaf spring clamped to the top tube and attached by a clip, which allows of a small adjustment to the supporting frame already

mentioned, under the centre of the saddle. The saddle is thus doubly sprung, and should be very comfortable to ride.

The saddle suspension adopted on the 1917 Indian flat twin.

# THE MORGAN VAPORISER.

A Road Test of a New Device for Heating Petrol Substitutes.

IN the issue of *The Motor Cycle* for September 21st last, page 248, we described a device of Sec.-Lt. E. B. Morgan for facilitating the vaporisation of heavy fuels. This device, as fitted to a number of different makes of motor cycles, was demonstrated a few days ago. The machines to which it was fitted were an Enfield, an A.J.S., a Douglas, a Triumph, a B.S.A., and an Ariel.

The Morgan is certainly a very satisfactory method of vaporising heavy fuel. It consists of a special exhaust valve cap, comprising a small gunmetal chamber, which is supplied to fit all the best-known makes. An auxiliary tank on the top tube contains sufficient petrol for start-

ing, and this is connected to the carburetter by means of a Y connection. Paraffin is taken from the main tank into the vaporiser, and then passes in a thoroughly heated condition into the float chamber. It is usual to retard the ignition slightly on the magneto-shaft.

The demonstration took place at 74, East Hill, Wandsworth Common, and was in charge of Mr. G. J. Rowley. The weather conditions were not very favourable for the test, but quite a number of people was present. The first machine we tried was a 1914 Triumph sidecar. This certainly ran satisfactorily on paraffin, but there was a considerable amount of knocking on hills and when

picking up speed after a check in traffic. This we have found to be prevalent on previous occasions and with other devices when paraffin is used. Our next run was on a 6 h.p. Enfield sidecar, in which no knock whatever was present. In the case of both machines the position of the spark lever had to be very frequently altered to prevent knocking.

The device is simple and should be effective, and certainly is an improvement not only when paraffin but when other heavy fuels are used. We had an interesting test on the 2½ h.p. Douglas with Petrofin passed through the vaporiser, and it gave very good results during a personal trial.

Morgan vaporiser fitted to A.J.S., Douglas, and Triumph machines respectively.

The vaporiser takes the place of the exhaust valve cap.

## Road Expert Joins the O.T.C.

MR. WALLACE E. RICKE, general secretary of the Roads Improvement Association, has joined the Artists' O.T.C., and the council has appointed Mr. James D. Haworth, of the firm of Major Tulloch and Haworth, consulting and civil engineers, of 28, Victoria Street, Westminster, S.W., as acting secretary during his absence. All Mr. Ricke's male assistants, both at headquarters and the various branches, have for some time been on Active Service. All communications to the R.I.A. should be addressed to Mr. Haworth at the headquarters of the Association, 15, Dartmouth Street, Westminster, S.W.

Lt. Arthur E. Wilson (Royal Warwicks) was wounded a few days ago. He is the son of Mr. Edward A. Wilson, managing director of the New Hudson Cycle Co., and was with that company before the war.

We are pleased to note that Vernon Busby, formerly technical expert to the Aston Motor Accessories Co., Ltd., and a despatch rider at the outset of hostilities, has lately been promoted to captain in the R.F.C.

## EXPERIENCES WITH DIFFERENT SUBSTITUTES.

IN spite of the expected increase in the allowance of petrol commencing November 1st, many motor cyclists will doubtless continue to use substitutes. During the past few months hardly an issue of *The Motor Cycle* has appeared that has not contained experiences with one or other of the many substitutes at present on the market, and for the benefit of readers we have classified the issues in which the experiences with the different fuels appeared. So that any reader thinking of running on, say, paraffin will be able to turn up without

any delay the experiences of other readers with the same fuel.

## OVERSEAS OPINIONS.

A RESTFUL HOME FOR WAR WORKERS.

NEW MODELS FOR 1917.

## New Models in This Issue.

Two entirely new models are described in this issue, viz., the 1917 type Morgan runabout and the Indian range for next year, which includes a horizontal twin lightweight.

## The National War Funds.

At the week-end the principal war funds stood as follow:

The Prince of Wales's Fund	£5,961,094	0	0
(£3,468,925 distributed)	4,421,673	0	0
British Red Cross Fund	170,712	8	1
Queen's Work for Women Fund	314,000	0	0
Kitchener Memorial Fund	114,896	0	0
Tobacco Fund			

## Shut Out Enemy Goods.

To prevent German magnetos—or indeed other goods of enemy origin—from reaching this country is perfectly simple. The Manufacturers' Union have but to meet and decide collectively not to use enemy goods on motor cycles, and they will have the whole-hearted support of the British riding public.

## Care in Selling a Machine.

A reader relates an unpleasant experience in selling a machine. According to our correspondent, a man, dark and short, and clean-shaven, calls upon the advertisers in the London district, and, if his cheque is not accepted, says he has no change and borrows a small sum to pay his fare home. No more is seen of him!

## B.S.A. Report.

The annual meeting of the Birmingham Small Arms Co., Ltd., is being held to-day. The report for the year ending July 31st, 1916, states that there are profits available for the payment of the usual half-yearly dividends to that date on the "A" and "B" preference shares and a further interim dividend to the ordinary shareholders of 15%, free of income tax, in addition to the interim dividend of 5% paid in April last.

## An Expert One-armed Sidecarist.

Seeing that the R.F.C. has enlisted several women as motor drivers, a one-armed reader of *The Motor Cycle*, who is an expert sidecarist riding continually on business bent, has written enquiring for a similar position. We have referred him to the R.F.C. headquarters, but should he be unsuccessful we should be glad to put any interested party into communication with our correspondent, who is anxious to release a man for active service. The writer in question has driven a sidecar machine over the Pennines in the snow, and has also climbed Stoneythwaite Rake and Walna Scar, and claims to be the only sidecarist who has ever climbed the last-named ascent.

## More Petrol.

The fact that more petrol will be released next month is indeed good news. It will certainly help to keep the home fires burning so far as motoring is concerned. Not that we think it desirable for people to motor extravagantly, but a reasonable amount of motoring for recreative purposes is of benefit to the nation as a whole on account of its wonderful health-giving properties.

## Racing in East Griqualand.

A couple of motor events figured in a sports meeting in aid of a Jutland Battle fund, held on August 7th at Tsolo, East Griqualand, S.A. These were a slow race and a serpentine race, and in both cars and cycles competed together. The first was won by a Ford driver, with J. W. Shoebottom (7 h.p. T.M.C. sidecar) second. The latter won the serpentine race, with F. W. Willows (3½ h.p. New Hudson) second.

## Another British Twin.

*Apropos* our recent articles on the subject of single v. twin, we hear that the B.S.A. Co. has under test a 6 h.p. twin-cylinder mount. It is unlikely to be marketed until after the war, the firm's energies being applied to munitions. In the meantime we may be sure that the new B.S.A. will receive an exhaustive test on the road. An acquaintance of ours has already tried its paces, and was greatly impressed.

## The Admiral Arbuthnot Trophy Fund.

The Auto Cycle Union, having heard that the Harley-Davidson Motor Co. were anxious to bring the Admiral Arbuthnot Trophy Fund to a round figure, decided to accept the kind contribution of this firm, which amounted to £5 15s. 6d., thus bringing the total of the Fund up to £220. We have also to mention the following contributions which have not been previously recorded: H. Taylor and Co., £1 1s.; and First-class Air Mechanic W. H. Morgan, R.F.C., 2s. 6d. This latter sum has been received from France, and in sending it the donor writes: "I would like to endorse Capt. Bennett's suggestion that the cup be for competition for members of both Services. I shall look for the result of this suggestion in *The Motor Cycle*, which, I am pleased to say, I receive and appreciate weekly."

## Thanks!

We have to acknowledge some flattering remarks in connection with our two years' work in recruiting and examining motor cyclists by *The Glasgow News*, *The Clarion*, *The Irish Cyclist*, and *The Motor News*, among other journals. These references have appeared since the magnificent exploits of the Heavy Section, M.G.C., with their armoured cars. All the men are motor cyclists or car drivers, and know how to drive their vehicle as well as man the guns.

## The Poor Sidecarist Again.

In munition centres during this last week-end hundreds of sidecar outfits were seen. There are still people so short-sighted as not to recognise that all motor cyclists taking out lady passengers in the sidecar are not "slacking." Neither can the accusation of extravagance be put forth, for we have frequently urged that it is economical to keep as "fit" as possible, and a respite from the continuous toil at high pressure from Monday morning till Saturday noon is absolutely essential. It is a national gain when the health of an individual munition worker is benefited.

## Discrimination in Petrol Allowances.

We sincerely hope that, with the issuing of the new petrol licences for the quarter commencing November 1st, the Petrol Control Committee may be able to discriminate, to a certain extent at any rate, between the claims of the pure joy riders and the man who uses his machine solely for business purposes. There can be no reasons of lack of time, etc., to go into special cases such as there were at the end of July and beginning of August, and if there is a repetition of the same amount being doled out for all motor cyclists the committee will be worse than unpopular.

## New Hudson Report.

The annual meeting of the New Hudson Cycle Co. was held last Thursday, (September 28th). The report recommended the payment of dividends at the rate of 6% and 7% per annum on the preference shares and a dividend at the rate of 10% for the year on the ordinary shares. Mr. E. A. Wilson, chairman, said the company had made great endeavours to keep its export trade together, but the firm had suffered severely in the home trade by its inability to cope with private business due to Government work. The directors, however, had no doubt the firm would ultimately be able to recover its ordinary trade.

**Warlike "Taxis."**

"Taxi" is the latest name for the now historical armoured car "tanks"—the men manning which were recruited through the pages of *The Motor Cycle*.

**A Removal.**

In the early hours of the 24th ult., when the Zeppelins visited the southern outskirts of London, a friend of ours had an H.E. bomb dropped in the garden, which exploded, and moved his garage completely for half an inch, straining the building considerably, but the Bat and sidecar therein suffered no damage whatsoever. No one in the house was injured.

**Water 2/9 per Gallon.**

A correspondent tells us that recently he was supplied with petrol containing about 25% of water. Some of this got into the tank and caused considerable trouble. The man at the garage asserted that it was taken from a freshly-opened sealed can. Our experience suggests that this is a most unusual occurrence.

**Flat Baby Twins.**

Some months ago we described and illustrated in these pages an experimental A.B.C. horizontal twin lightweight, which was intended as an "after the war" production. A strikingly similar mount described in this issue is the very latest product of the Indian factory.

**American Enterprise.**

As an instance of American keenness in extending their foreign trade, the sales manager for an American motor cycle firm recently returned from a journey of 60,000 miles, the object of which was to study first hand the requirements of such countries as China, Japan, Java, India, and the Colonies. Incidentally, centres were established where spare parts of the particular machine may be obtained.

**The Coming Trade War.**

In "Pearson's Magazine" for October is an article entitled "Even then —," which should cause every man and woman in Great Britain "furiously to think." It concerns the economic war which is soon to begin. The Germans openly boast that a nation of 75,000,000 cannot be crushed, and that even if the Allies beat her to the dust in the present conflict she will be successful in capturing her lost trade afterwards. British and German trade in 1913 showed a balance in manufactured goods in Germany's favour of £36,000,000. This price we paid as a tribute to the "god of cheapness." We are paying the price in blood now. The writer suggests protective duties and State assistance as an essential future safeguard. But a remedy would then have to be found to prevent German goods from coming into our country through neutrals as neutral manufactures. An official trade mark or brand is suggested for all *British* goods, the idea of which reads very convincingly, the one suggested by the writer being "The Lion Rampant." The article will appeal to all patriots, for the danger will after the war be real indeed. To have to face the competition of neutral countries which have not felt the shock of this conflict will be bad enough. It behoves us in consequence to use every device possible, and to concentrate all our efforts on winning the war after the war.

**A New Service Paper.**

We have received still another Service paper—this time under the title of *The Direct Hit*. It is the brightly written monthly of the 58th London Division. The articles are varied, and the magazine will evidently appeal to all sections, in khaki and out, of its readers. There is an abundance of humour and the sketches are good.

**In Tennyson's Country.**

Among the huge army of motor cyclists there are undoubtedly many admirers of Tennyson's poems. Those who wish to know something about the district in which he lived and from which some of his highest inspirations came should obtain a copy of yesterday's issue of *The Light Car*, in which is a descriptive illustrated ride in Tennyson's country by a writer who is not unknown to motor cyclists.

**Cruelty to Lightweights!**

A few moments before penning this paragraph the writer saw three up on a 2½ h.p. two-stroke motor cycle, in pillion fashion. Though that may be unusual, it is not rare to see these light machines very badly abused. Occasionally one sees a light sidecar tacked on these lightweights, and very frequently a heavy passenger on the carrier. It is not fair play, and one should remember that there are limitations.

**The New Indian Opposed Twin.**

Once more we find American designers following the lead of British manufacturers. In an article in this week's issue on the new Indian models is an illustrated description of a new horizontally-opposed twin Indian. Details of the machine need not be mentioned here, but every motor cyclist knows and will give credit to the original British designer, who was the first to see its possibilities, and to carry out his ideas on an issue, which has unquestionably been one of the greatest successes in the motor cycle industry.

**The Big Emergency.**

Most motorists can recall numerous little emergencies, each one proof that a big emergency may lie just round the corner. When it does come, will your brakes hold? Are you sure? Are you prepared for the autumn grease with non-skid tyres; but, above all, will your brakes hold? Try them, for a life may sometimes depend on the brake alone.

**Petrol Licences for the Next Quarter.**

Readers are advised to fill in during the next few days the form of application for the supply of petrol for the three months commencing November 1st. Application forms will be found at the end of existing licences, and they should be sent to the secretary, Petrol Control Committee, 19, Berkeley Street, London, W. By so doing little risk should be run of being stranded at the beginning of November without a licence to purchase petrol, as was the case with hundreds of people last August.

**Motor Cycle Tyre Pressures.**

It is not usual for manufacturers of motor cycle tyres to tell their customers to what pressure the tyres should be pumped up. This, however, is not the case in the United States. In the case of 3in. tyres for powerful motor cycles, such as are sold on the other side of the Atlantic, a pressure of from 45 to 50 lb. should be maintained in the rear tyre and 20% less in the front tyre.

**Sewer Inspection by Motor Cycle.**

A sanitary engineer at Pasadena, California, had recently to inspect six and a half miles of sewer which had been completed in that city. This he accomplished by motor cycle. The machine was lowered into the tunnel through a shaft, and the engineer rode on the carrier, scrutinising the walls as he was driven along by his companion. Frequent stops were made for careful inspections, and no difficulties were experienced whatsoever throughout the trip.

Motor cyclists are performing valuable work in this great war in addition to despatch riding. The motor cycles shown are Douglasses.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

#### The Scott Sociable.

Sir,—I am a keen Egyptian reader of your most interesting paper *The Motor Cycle*, and I noticed in the issue for September 28th the drawing and the letter of Sgt. Way, about the Scott Sociable. I think myself that his idea is a splendid one, as putting the front wheel in the centre makes the little car look beautiful, and if it is put on the market for a moderate price I am sure there will be a great rush for it, and I shall be one of the first. M. BANNOUNAH.

#### Petrol Permits.

Sir,—I have been wondering if any other of your readers have had the same experience of the Petrol Committee as myself.

About a week before the closing day I posted an application form. No permit came. I wrote twice, and, getting no reply, sent a registered letter. Still no reply. I then asked the A.A. and Motor Union to intercede for me.

On the 16th ult. I received a permit from the committee. The next morning I received another permit through the A.A. and Motor Union. I sent the duty, and got my licence on the 19th ult. On the morning of the 25th ult. I received another permit from the committee. That is three permits in eight days. CR 2454.

#### Motor Machine Guns.

Sir,—Being now a member of the Heavy Section and originally recruited for the M.M.G.S., I regret to hear that in the future recruiting for both corps will be arranged by the various Commands. I sincerely trust that your esteemed paper will still take an interest in our doings.

*The Motor Cycle* has always been eagerly bought and greatly appreciated amongst the officers and men of both corps, and it would indeed be greatly regretted by all of us, should your paper lose all interest in our work, more so, as in the near future we hope to do great deeds.

GUNNER L.P.

[We thank "Gunner L.P." for his expressions. It is certainly not our intention to lose interest in the men of the Machine Gun Corps (Motors)—on the contrary, we admire them more in consequence of their great achievements. References to their doings have appeared in three successive issues.—ED.]

#### Lightweight Sidecars.

Sir,—I should be glad if you will spare me space in your much valued journal to combat some of "Ixion's" sweeping assertions regarding the unsuitability of the two-stroke lightweight motor cycle for sidecar work. I may say I have had no experience of the Douglas with sidecar, so will confine my remarks to the two-stroke.

First of all, I think he should state what he calls a "Baby" two-stroke, for most engines of this type are necessarily small unless water-cooled.

For the last eighteen months I have been riding a lightweight Monarch, engine 2½ h.p. Peco, Albion two-speed, 2½ in. tyres, and sidecar (Empire lightweight model). Last summer this outfit took myself and passenger from here to Weston-super-Mare comfortably in the day without any stop except for refilling and meals. While there, with the same load, I climbed Cheddar Gorge, also without exertion. I did a fortnight's riding round Weston, and returned to Manchester in nine hours. The outfit has been in constant use since then, and this year took a similar load with the addition of two tins of that precious fluid (petrol) to Barmouth and back without a hitch, and while there climbed

some hills possessing alleged roads covered with loose flints, in places very little better than mountain tracks. After this severe test when ridden solo, there is no suspicion of the bicycle frame having been strained in any way, and the outfit is still perfect.

I trust this experience will allay some of the trembles "Ixion's" remarks are likely to cause. To all interested in a similar type of outfit I would say, choose a good machine, and line up the sidecar properly, and you are all right. Usual disclaimer. NIL DESPERANDUM.

Didsbury, Manchester.

#### The Cause of Overheating.

Sir,—I should like to add more data to the "silent discharge" question. Like Mr. Cox, I attribute this occurrence to the plug. I have tried a test with three plugs on a well-known Derbyshire inclined stretch, with the following results:

(1.) British plug with thin electrodes. After a stretch of full throttle the pre-ignition knock was produced.

(2.) British plug with substantial electrodes. Very much better results, but with a gradual falling off of power until the engine gave out, without the slightest trace of a knock. Evidently the "silent discharge."

(3.) An old Bosch produced the best result of all, but I abandoned the driving to a finish, as the cylinder was too warm for the comfort of my calves.

The facts convince me that—

(a.) One engine may be subject to both phenomena.

(b.) This is only a question of plug efficiency.

(c.) The necessity for British plug manufacturers to awake to the fact that their goods leave room for improvement.

The temperature query is very confusing, as the pre-ignition knock took place, naturally, with the plug points incandescent, but only a moderate internal engine temperature; whereas, when I examined the second plug, I found the points showed less sign of heating, but the engine temperature was very much higher.

Can any of your correspondents deduce anything further from my experience? H. S. MARR.

#### Oh, for the Open Road!

Sir,—I am a very keen motor cyclist, and, as an interested reader of your excellent paper for some years, I often intended to write to you, yet, lo! this is my first effusion.

I can tell you one does miss "the old 'bus" out here, and the arrival of *The Motor Cycle*, which I get sent out weekly, is very welcome.

"The old 'bus" indicated above is a travel-worn 3½ h.p. three-speed Singer placed at the tender mercies of my cousin for the time being. My friends say that the name was ill-chosen, as it obviously should have been called the "Whistler," on account of the cheerful warble the crank case release makes as the engine is stopping! The engine had a bit of a turn for speed when I left, but though my prayers are with the machine often, I expect that its miles per hour will have tumbled down considerably ere the Hun is pushed across his "all fired" Rhine!

There is a long straight piece of pretty good *paré* running past our camp and the D.R.'s fairly scorch past within 30ft. of my hut, thereby unwittingly stirring up a vast amount of envy, hatred, malice, etc. As far as I can gather, the Triumph is very popular out here, as it appears to stand up to the road shocks well.

The old 3½ h.p. single is still my favourite, although I have ridden many other types, from a Sun-Villiers to a

6 h.p. A.J.S. For some time I have been very keen on Sunbeams. At home (Ireland) the way in which the  $3\frac{1}{2}$  h.p.'s of this make whirl good solid sidecars round a hilly country with apparently the greatest of ease is an eye-opener. Again, in our training centre in England I had the use of a W.O.  $3\frac{1}{2}$  h.p. Sunbeam for a couple of weeks. Although it had had over a year of hard work and lots of abuse it was the sweetest running engine imaginable—fast, quiet, and seemed absolutely to revel in work. Judging by these experiences, I imagine that a new  $3\frac{1}{2}$  h.p. T.T. Sunbeam model carefully run in and kept in good condition should be very "hot stuff" apart from its other qualifications.

B.E.F., France.

J. H. HANCOCK, Sec.-Lt. R.E.

### Electric Lighting for Motor Cycles.

Sir,—I note that in an article in *The Motor Cycle* of September 28th, entitled as above, the writer states that he still holds to the celluloid type of accumulator. My experiences in the way of electric lighting may be of use to others who, like myself, dislike intensely the "messiness" of carbide. Two years ago I started electric lighting by fitting a Dynalite. This was a very satisfactory article, its only disadvantage being that the light stopped when I stopped. Therefore, I fitted a celluloid accumulator of good make in the way suggested by your contributor under the seat pillar. This, I found, rattled to bits in 500 miles, and was constantly under repair. I then fitted a Hellesen dry battery, and found that perfectly satisfactory.

On my present machine I have fitted a Lucas dynamo lighting set, with an Alkum steel accumulator fixed to the two back forks, upper and lower, of the right-hand side. Contrary to the expectations of both Rudge's and Lucas's London representatives, the balance of the machine was not upset.

Referring to another article in the same issue, where your contributor condemns the single cylinder type, I have found this type perfectly satisfactory. My present bicycle is a Rudge-Multi I.O.M. Tourist Trophy model. My speed ranges from 6 to 65 m.p.h., even with the extra load of the lighting set.

E. R. D. NAGEL (Sec. Lt.), R.F.A. ATTACHED R.F.C.

[We have found a celluloid accumulator mounted on the left footboard stand up perfectly well; this has been in constant use for two winters.—ED.]

### Overhead Valves.

Sir,—I am enclosing sketch of an alteration which can easily be made to the Indian motor cycle of the overhead inlet valve type. Overhead inlet valves always make considerable noise unless enclosed, especially on this make of machine. If the small springs fitted between the overhead rocker arms and inlet domes are removed and put between the bottom of the operating rods and valve gear case, the noise will be greatly reduced. One end of the spring will need to be slightly opened out to bear on the dust covers at the bottom of the rods.

I noticed C. Mather's letter in the issue of June 8th. This idea can easily be applied to the Binks carburetter. A good size copper pipe is led from the top of the cylinder to the bottom of the main air intake orifice. The end of the pipe must be brought as close as possible to the throttle barrel without causing it to stick, so that the engine sucks hot air through the pipe when the pilot jet comes into action. I have tried the idea with my own Binks carburetter, and find a great improvement after a few hundred yards running.

I have read with interest all suggestions for home-made improvements which appear in your instructive paper from time to time.

RHODESIAN.

Gatooma, S. Rhodesia, South Africa.

### Will the Single-cylinder Survive?

Sir,—I have read with interest "Road Rider's" article on "The Future of the 500 c.c. Single" in your last issue. Does he not rather contradict himself? In his opening paragraph he says, "I believe that the 500 c.c. single-cylinder is doomed." But towards the end of his article he says that the "future of the 500 c.c. single is limited to the light T.T. patterns." Now this last mentioned type of machine is certainly one of the most popular on the road. Hence, if the single is to be limited to this class surely we shall still see many about. It is more economical, more powerful, and certainly simpler to take down. I myself own a  $3\frac{1}{2}$  h.p. T.T. single of well-known make, and I can get 100 m.p.g. At the same time, the engine will tick over at 6 m.p.h. and accelerate up to 65 m.p.h.

"Road Rider" also speaks of vibration in singles. I have ridden a  $2\frac{3}{4}$  h.p. twin in which there was more vibration than in my mount.

Amongst public school fellows the T.T. single is certainly the favourite of all machines, and we will always support this class, and there are plenty of us who own motor bicycles, too. I am at one with the editorial comment that it will be a very long time, if at all, before that most popular mount, the  $3\frac{1}{2}$  T.T. single, disappears from our roads.

J. S. SIMPSON.

Sir,—It does not seem to be generally recognised that an entirely new class of motor cyclist has come along, a class which, instead of graduating from the cyclists' ranks, has, through forced circumstances of the war, descended from being a car owner to a motor cyclist, thus reversing the usual process. This man, who has been used to a four-cylinder engine with automatic lubrication, finds a single-cylinder engine, with its crude lubrication, crude carburetter, and its horrible vibration, something so bad that he would rather forfeit motoring altogether than put up with it.

It is not a case where "Ignorance is bliss," as he knows what can be got from a properly designed motor unit. Being indeed one of these men myself, I cannot help but marvel and admire the pluck and enthusiasm of the motor cyclist under these conditions. When I can buy a four-cylinder-engined motor cycle with an automatic carburetter, automatic lubrication, and spring frame, then, and not till then, will I become a motor cyclist again.

ENGINEER.

Nottingham.

### American Motor Cycles.

Sir,—No one denies that American machines have many good points, but the plain truth is that they are neither so reliable, nor do they last so long as the British-made article.

American engineering does not produce machinery to last. In 1900 several British railways bought American goods engines of the 2-6-0 or Mogul type. To the best of my knowledge every one of them is now scrapped. Yet the same companies are all still using daily English engines built in the seventies and early eighties. It pays to rebuild the British engine, but not the American.

At the Front the American aeroplane engine has been tried and found wanting. All our aeroplanes are of British or French manufacture.

The same thing applies to motor cycles. I have ridden a 5 h.p. Yankee, and my present mount is a 5-6 h.p. Ariel. I am one of those restless motor cyclists who are always buying and selling machines, and I have had experience of a good number. For sweet and easy riding I have found nothing to beat the F.N. As a solo mount, I have strong preference for the  $2\frac{3}{4}$  h.p. Douglas and the  $3\frac{1}{2}$  h.p. T.T. Triumph, but for a fast and reliable no trouble sidecar machine the Ariel is hard to beat. My next machine will be a big twin, and I do not greatly mind whether it is an 8 h.p. Zenith, Matchless, Bat, or Sunbeam, but it will not be an American. Patriotic motives bar that; but, wholly apart from them, I am convinced that the British article is the better thing. My Ariel was two years old when I bought it. It had been badly neglected and hardly used, yet after a simple overhaul and renewals that cost but a few shillings, it has run a whole season without giving the least trouble. Where is the American machine that would do that? Time is the test, and the prices of British and American second-hand machines tell the tale.

East Dulwich.

PROSPERO.

## NAVAL AND MILITARY NOTES.

Airmen Motor Cyclists. The Substitution Scheme.

### ANOTHER AIRMAN MOTOR CYCLIST MISSING.

WE regret to hear that Sec.-Lt. O. C. Godfrey, R.F.C., on Saturday, the 23rd ult., was forced through engine trouble to descend in the German lines, and is reported to have been taken prisoner. Details, however, are lacking, but it is to be hoped that Godfrey is safe.

### THE LATE FLIGHT-LT. GRAHAM.

THE body of Flight-Lt. C. W. Graham, D.S.O., R.N., has been recovered from the sea, and the funeral took place with full naval honours on Saturday last at Barnes Common Cemetery. The late Flight-Lt. Graham was accidentally killed off the coast of Belgium, and his portrait appeared in *The Motor Cycle* of a fortnight ago.

### BIRMINGHAM AIRMAN MOTOR CYCLIST MISSING.

THE name of R. H. Edwards will be familiar to thousands of our readers, as he was a well-known Triumph rider, and competed with considerable success in the various motor cycle events organised by Midland clubs. Some months ago he was granted a commission as a pilot in the Royal Flying Corps, and is now, we regret to learn, officially reported by the War Office as missing since the 22nd ult.

### WELL-KNOWN DESIGNER IN THE R.F.C.

CAPTAIN G. W. A. BROWN, recently gazetted as an equipment officer of the R.F.C., is the designer of the Premier twin-cylinder two-stroke motor cycle, and was formerly works manager of the Premier Cycle Co., Ltd., of Coventry. He is known in the car world mainly by reason of the fact that he designed the 25 h.p. Talbot that was the first car to cover over 100 miles in the hour.

### THE NEW SUBSTITUTION SCHEME.

SOME months ago, in consequence of applications received from men ineligible for service for positions in motor cycle works, we inaugurated a list of ineligible and discharged men, and offered it on several occasions through our columns for the benefit of manufacturers who desired to fill positions or release fit men anxious to enlist. As a result of this scheme quite a number of manufacturers applied to us from time to time for the list, and a number of ineligible men found positions in this way.

The War Office has now officially adopted such a substitution scheme, the object and scope of which is that men fit for general service are to be released from munition work and other employment and made available for the Army. The definite statement is made that no fewer than a million men must be found for the Army during the next twelve months. A substitution bureau is being opened at each recruiting office, and lists of substitutes will be kept, the men's occupations and previous employers being recorded. Employers are being invited to inform recruiting officers of the number of fit men for whom they are able to take substitutes. Negotiations will then be carried out between employers and the recruiting office in order that men fit for the less arduous duties at home may be substituted for men passed Class A—

General Service. An invitation is also extended to men rejected for service of all kinds who might be able to perform useful work in munition factories and so release general service men.

### LADY MOTOR CYCLISTS IN BELGIUM.

SOME little time ago we reproduced in these pages a photograph taken in England of two lady motor cyclists attached to the Belgian Red Cross. The accompanying picture shows these two ladies, Miss Chisholm and the Baroness de T'Serclaes, on their Douglas motor bicycles in a village behind the Belgian lines. They are attached to an Army divisional dressing station quite close to the front trenches. Miss Chisholm rides a 4 h.p. Douglas, while her companion, who is the English wife of a Belgian nobleman, rides a 2½ h.p. open frame machine of the same make. Miss Chisholm tells us that she very much prefers the heavier machine, as it rides more steadily over the appalling roads.

They are situated rather to the east of the Belgian lines at the point where the Yser narrows, and there is only a gap of thirty yards between the German and Belgian trenches. Motor cycles are invaluable on account of their handiness, and Miss Chisholm and the Baroness are the only lady motor cyclists in the region.

Miss Chisholm and the Baroness de T'Serclaes on their Douglas motor cycles at a picturesque village just behind the Belgian lines. They are attached to the Belgian Red Cross Society.

## THE PERFECT MOTOR FUEL

Which starts from **DEAD COLD**.

After exhaustive chemical experiments and tests **WE HAVE EVOLVED THE MOST PERFECT PETROL SUBSTITUTE** on the market. Our old recipe was very good so far as ordinary running was concerned, but we recognised that the saving in £:s.:d. was not extra great on account of having to mix with 50% of petrol, and as motor cyclists now are only allowed by the Government small quantities of petrol we found that this state of affairs could not go on, hence we set to, and, after exhaustive tests, are now able to supply a fuel which will, without exception, **start from dead cold**. This fuel is much more volatile, quick to respond to acceleration, decarbonises, no knocking on hill-climbing, and it decidedly increases miles to the gallon.

### UNBIASED OPINION.

Extract from "The Motor Cycle," pages 266 and 267, September 28th, 1916.

With the Wital fuel mixture we found it particularly necessary to keep up the "revs," and by doing this it was possible to make very fast ascents.

There was no sign of overheating on hills, most of the long ascent being accomplished on the 35 m.p.h. mark, and by what may almost be regarded as a coincidence, the second round was accomplished within five seconds of the time taken on the first round. We append a table giving at a glance the comparative results:

Fuel	m.p.g.	m.p.h.	Distance.
$\frac{1}{3}$ petrol, $\frac{2}{3}$ Wital ..	82	28 $\frac{1}{2}$	29.7 miles.
All Wital .. ..	83	28 $\frac{1}{2}$	29.7 miles.

Summing up, the Wital fuel would appear to be an excellent petrol substitute, and no motor cyclist need hesitate in sampling it.

What a user says : Original can be seen at our office.

August 22nd, 1916.

Dear Sirs,

I have pleasure herewith in giving my experience in running on WITAL MOTOR FUEL, and also the improved spirit which you were kind enough to let me have a tin of.

The conclusion I have come to as to the former is that it is a good stop-gap in place of petrol.

I am of the opinion, however, that there is a great improvement in the new spirit. At a test on the latter this evening, my air-cooled 8 h.p. Morgan Car started up from cold by simply flooding the carburettor (and no other adjustment was made beyond this). I then proceeded to test the acceleration, which was all that could be desired, both on the level and up-hill. With reference to the latter, my car, carrying two people, climbed on top gear the well-known Luddington Hill, leading from Colebrook to Tarporley. There was an entire absence of overheating or knocking, and the general performance, saying the least, was quite equal to petrol. During this test both starting and running, there was no more than 10% of petrol mixed with the spirit, and I am of the opinion that equal results could be obtained by running entirely on the improved spirit.

A colleague of mine has also ordered this spirit, after having tried same, and proving satisfactory.

I should be pleased to give any further information that you may desire.

Yours faithfully, HIGHWAY SURVEYOR.

P.S.—I have ordered two more barrels, and am now awaiting same.

**WITAL MOTOR FUEL** is a genuine Petrol Substitute. It is cleaner and has no offensive smell or smoke. It will not harm the Engine in any shape or form. You can store any quantity you like, as there are no Government restrictions and, you do not require a licence to keep it.

**WITAL MOTOR FUEL** is of a slightly heavier gravity than Petrol, but there is a great gain in miles to the gallon; and we can let you have immediate delivery in 42 gallon casks.

All orders received will be placed on the rail within 24 hours of receipt of same, and you can pay your money through the Deposit System of "The Motor Cycle."

Cash with order. Barrels 9/- each and credited on return. Carriage paid to nearest Railway Station.

Cheques sent direct to be crossed Lloyds' Bank, Ltd.

# QUESTIONS & REPLIES

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

## What Constitutes a Noisy Machine?

?

(1.) What constitutes an efficient silencer to be used on a motor cycle? (2.) What is meant by a "cut-out"? (3.) In what respect is it illegal to use one?—D.L.S.

(1.) The Silencer Regulation says it is compulsory to have a silencer fitted to motor cycles "suitable and sufficient for reducing as far as may reasonably be practicable the noise which would otherwise be caused by the escape of the exhaust gases into the atmosphere." (2.) A cut-out is a device which allows the exhaust gases to enter into the atmosphere without first passing through an expansion chamber. (3.) The Local Government Board Regulation says: "He shall not use any cut-out, fitting, or other apparatus or device, which will allow the exhaust gases from the engine of the motor car to go straight into the atmosphere without first passing through a silencer, expansion chamber, or other contrivance."

## Poor Acceleration.

Q

I have a two-stroke which is very bad at accelerating from dead slow or turning moderately slowly on a hill, and I have to rush a hill of any size. I have an Amac carburettor with 25 jet. I can give full air and get over 120 miles to the gallon, so you will see that there is not much wrong. I have tried bigger jets, but found no difference. The compression is excellent, but the rings have a very slight up and down play in the slots. I fitted a set of oversize rings from the makers, and fitted them with  $\frac{1}{4}$  in. gap. Then I got no compression at all, and it would not go, so I had to put the old rings back. Can you tell me what is the matter, and also why the new rings, although bigger, gave no compression? Would a two-speed gear be an advantage?—C.G.

It is difficult to say definitely what is wrong with your machine from the description you give. The reason the new rings gave no compression was because they did not fit the cylinder accurately; they probably needed lapping in with emery. New rings nearly always give poor running until they are run in. Your lack of power may be due to one of the following: Too small a jet, choked exhaust outlet, ignition insufficiently advanced, or too high a gear (if single-gear it should be about 5 or 6 to 1). You would probably find a two-speed gear a great advantage.

## Failure to Respond to Throttle Opening.

?

I should be glad if you could give me some advice as to what is wrong with my motor cycle. Up to a week ago I could get a speed of 38 m.p.h. out of it.

Owing to the control wires jamming, I had new ones fitted. Since then I have not been able to get more than 20 m.p.h. out of it. I start on low gear with the air shut and throttle about a quarter way open, and then draw the air up to the throttle. When both controls are half-way open, that is the most I can accelerate, and it makes no difference if I open up full gas or air: there is no increase in speed. There is a good spark, excellent compression, and no leaks anywhere; the cylinder is clean, and the valves have been recently ground in; the tappet clearance is the thickness of a visiting card. I used to be able to get up a good big hill on top gear easily, but lately have only been able to get up on low gear. As I do a great deal of riding, I should be glad if you would let me have your advice on the matter.—T.B.

All we can think is that the control wires are still jammed, and probably the throttle is not opening properly, or possibly you have reassembled the carburettor wrongly. We should recommend you, therefore, to take down the carburettor and examine it very carefully, making sure that the throttle opens fully.

A sidecar made by Mr. W. R. Gaudie, confectioner, of Jarrow, the owner of the Bat motor cycle to which it is attached. The back part holds eight trays for cakes, and the front four boxes, which in this case are used for crockery. The design is well thought out and it makes an admirable delivery van.

## Pitted Exhaust Valves.

?

In my 1912 Zenith-Gradua with J.A.P. engine the valves pit very quickly. I bought it second-hand, and after 300 miles have ground the valves in again. The timing is set as follows:

Exhaust valve opens 70 mm. from top  
= 130° = 15 mm. from bottom.

Exhaust valve closes 3 mm. from top  
= 20.5°.

Inlet valve opens 1.5 mm. from top  
= 14.5°.

Inlet valve closes 82 mm. from top  
= 130° = 3 mm. from bottom.

Do you approve of the overlap of the opening of the inlet valve and the closing of the exhaust valve for touring machines? Could this overlap have anything to do with the excessive pitting? It seems that the repeated grinding in of the exhaust valve has brought it down nearer the tappet, and thus increased both the extent and duration of the lift, being 7 mm. and 289.5° respectively now, though the distance from the tappet (0.5 mm.) seems right. I feel tempted to file off 1 mm. from the exhaust valve stem, but await your advice, not knowing what was the original lift when the machine was new. Or am I entirely on the wrong track, and should the stem of the inlet valve be lengthened so as to bring it also within 0.5 mm. of the tappet? The valve stems run true in the guides without friction.—W.D.

We fancy the cause of your valves pitting is not altogether due to the timing, but is far more likely to be due to overheating, caused by poor carburation, giving too strong a mixture, choked exhaust outlet, or inefficient lubrication. If all these points are correct, then faulty material seems to be the most likely cause. Nickel steel is usually found the best metal for valves, the larger the percentage of nickel the better. The timing we favour for touring is as follows: Exhaust valve to close with piston on dead top of stroke, inlet to open immediately the exhaust has closed. We think if you see these two settings are right you can leave the closing of the inlet and opening of the exhaust to the cam design; but, roughly, the inlet should close slightly over bottom dead centre, only a few degrees, and the exhaust should open, roughly, one-seventh of the stroke from the bottom. The lift of the valves should be as great as possible. We should advise you to allow the valves to lift the full height of the cam consistent with having about .4 mm. tappet clearance.

### Gear Ratio.

**Q.** (1.) What should the top gear ratio be of a  $3\frac{1}{2}$  h.p. single-cylinder motor bicycle fitted with a sidecar? The rider and passenger weigh 23 stone in all. (2.)

Why should the outfit stop about every two miles and then start again without difficulty? The carburetter has a 34 jet, and it and the engine are perfectly clean. The engine seems to race when descending a hill.—J.C.

(1.) The top gear should be about  $5\frac{1}{2}$  to 1. (2.) The trouble can quite well be due to the plug, the points of which become incandescent and cause pre-ignition. Use a good single-point plug, and we think the trouble will cease. Also make sure that the petrol supply is not partially choked.

### Popping in the Carburetter.

**Q.** I shall be very much obliged if you can tell me what is wrong with my 6 h.p. twin Jap-Zenith, 1912 model, with Zenith Gradua gear, which I run with a Gloria sidecar. The engine gets very hot indeed. Thinking it required a clean out I took the engine down, cleaned all carbon deposit off the pistons, also had the rings off and cleaned at back and under the rings. I cleaned all deposit from the inside of the cylinders and valve ports. I have fitted one new piston ring at the top of each piston, ground in the valves, and fitted two new exhaust springs. Since refitting the engine up I am still troubled with overheating. The crank case gets too hot to bear my hand on; the cylinders get so hot that they burn holes in my overalls. Blowing back occurs through the carburetter, and fire is blown through the air intake. Then the engine falters, and I have to drop into low gear and almost close the air lever until it picks up again. The engine will not take full air at any speed. I use a 32 jet in the 1912 B. and B. carburetter. A friend of mine tells me I have got my timing set for speed work and most unsuitable for ordinary touring with sidecar. It is set as follows: Valve timing. The exhaust opens  $\frac{1}{8}$  in. before the piston reaches the bottom of the stroke, and closes  $\frac{1}{8}$  in. over top dead centre. The inlet valve opens on dead centre and closes when the piston is  $\frac{1}{8}$  in. up the compression stroke. Magneto timing. With the ignition lever set two-thirds retarded. The points are just about to break with the back piston on dead centre. What is the cause of oil being thrown out between the crank case and the pulley?—F.W.C.

The popping in the carburetter is undoubtedly due to rather too weak a mixture; try a slightly larger jet. It is almost impossible to tell whether an engine is overheating by placing your hand against the cylinder, as an air-cooled engine always runs at such a temperature that it is impossible to hold one's hand on it even when it is running cool. Sometimes a badly fitting piston ring will cause the crank case to get rather hotter than usual. Provided the engine runs satisfactorily it does not matter how hot it gets. We fancy you will find the following timing correct for

ordinary touring: Exhaust valve should close on the top dead centre, the inlet to open immediately after. If you see to these two settings the opening of the exhaust and the closing of the inlet will come automatically correct. Your spark seems to be about right. You should adjust the carburetter so that up to half throttle opening you should be able to give more air than throttle, but after half-way rather more throttle than air to obtain the best running. If you have the carburetter so adjusted your jet is about right. You should have to shut the air fully for starting. The cause of oil leaking from pulley bearings is due either to a worn bearing or to a faulty crank case compression release valve. A felt washer fitted between the pulley and crank case might improve matters.

### IMPORTANT NOTICE.

#### GOODS MADE IN GERMANY.

The proprietors of this journal, being fully in accord with the recommendations agreed upon at the Paris Economic Conference, give notice that they will not permit the advertisements of new goods manufactured in enemy countries to appear in this publication, either during or after the war.

ILIFFE & SONS LTD.

### Motor Cycles by Rail.

**Q.** What is the cost per mile for conveying a motor cycle and sidecar by rail?—V.J.

The railway rates regulating the conveyance of motor bicycles and sidecars by passenger train are exceedingly complicated. Up to but not exceeding twelve miles the cost, at owner's risk, is 2s. accompanied by passenger, 3s. if unaccompanied by passenger, and 3s. 9d. at company's risk. A motor tricycle with more seats than one (which we imagine means a sidecar) is charged for at one-third over this scale for each additional seat. Full particulars are given on page 240 of the "Auto Cycle Union Touring Guide," which is free to members.

### Heavy Petrol Consumption.

**Q.** I have a  $2\frac{1}{4}$  h.p. motor cycle. Would you tell me what to do to lower the petrol consumption? At present it is only doing 40 to 50 m.p.g., which is abnormal. It has a No. 26 jet (which is the smallest size jet it will fire on) and a Bosch plug. I have had the engine to pieces, and thoroughly cleaned and overhauled it, with no better results. Would lowering the petrol level or raising it have any effect? The magneto appears to be in good order.—V.J.

The consumption, of course, is very bad. Without actually examining the machine, it is difficult to say what is the cause of this. If a 26 jet is the smallest the engine will take, it does not seem as if you can do very much in this respect, but it might be possible to make the engine take a smaller jet by carefully overhauling the carburetter and eliminating all air leaks. Also see that there are no leaks at the petrol pipe unions or at the filler cap.

### Paraffin Vaporisation.

**Q.** Having been invalided home from France, I am now using my motor cycles. The 4 h.p. Douglas runs very well on paraffin, but I cannot get any power with it on the B.S.A. If I run the paraffin through the valve cap, as an A.J.S. rider recently advised, would not the paraffin get too hot? If it were to boil would it not be dangerous? What arrangements could I make with the standard B.S.A. carburetter to take paraffin?—W.B.

In order to obtain the best results on paraffin, perfect vaporisation is essential. The idea of running paraffin through a special valve cap is quite good. We do not fancy there would be much danger if the paraffin were to boil, except air locks in the supply pipe. Much the same result would be arrived at by passing the feed pipe around the cylinder. All air drawn into the carburetter should be taken from some position close to the hot engine. Keep the induction pipe as warm as possible.

### EXPERIENCES WANTED.

Readers desirous of obtaining the experience of others with various motor cycles or accessories must enclose a stamped addressed envelope in which the replies may be forwarded. Answers to the queries should be addressed c/o The Editor.

"C.B.C." (Sunderland).—1913  $3\frac{3}{4}$  h.p. Scott sidecar running on a petrol-paraffin mixture.

## Which Book will Interest You Most?

The volumes we issue dealing with Royal Enfield Motor Cycles form a perfect library of motor cycling literature. Which book will interest you most?

We publish (1) a very complete and copiously illustrated Motor Cycle Catalogue; (2) a book for ladies interested in motor cycling; (3) an illustrated handbook for each model we manufacture; (4) a volume, which will be issued shortly, dealing with the motor cycle and sidecar from the owner's point of view, and other lists, smaller but none the less interesting.

Any of these books will be promptly sent on request. Mention "The Motor Cycle" and the particular volume you would like.

The **ONLY BELT** for Gradual Gears.

THE  
"ZILLA" BELT  
LEATHER & RUBBER.

**UNBREAKABLE:** Because the whole pulling strain is taken by a steel chain core, manufactured to withstand from 3 to 4 times the pulling strain of any motor cycle yet built.

**NON-SLIPPING:** Because the leather and rubber washers on the chain have 50% greater driving surfaces than leather or rubber belts, and the combination of leather and rubber will grip the driving pulley in any weather.

**FASTER DRIVE:** Because the washer and chain construction gives a flexibility which allows the Zilla Belt to "hug" the smallest pulley without that great internal friction and force required to teud an ordinary belt round it.

**JUST THE THING FOR SIDECAR WORK,** especially in changeable weather or in exposed positions.

THE BELT THAT SAVES 10% OF PETROL.

# MISCELLANEOUS ADVERTISEMENTS.

## PRICES.

**ADVERTISEMENTS** in these columns—First 12 words or less 1/6, and 3d. for every two words after. Each paragraph is charged separately. Name and address must be counted. Series discounts and special terms to regular trade advertisers will be quoted on application.

Postal Orders sent in payment for advertisements should be made payable to **ILIFFE & SONS Ltd., and crossed** & Co.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle" Coventry, or London (20, Tudor St., E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

## NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charge. Only the number will appear in the advertisement. All replies should be addressed, "No. 000, c/o 'The Motor Cycle,' 20, Tudor Street, E.C."

## DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding 10 in value, a deposit fee of 2s. 6d. is charged, when under 10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

## SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

## MOTOR CYCLES FOR SALE.

## DEFENCE OF THE REALM ACT

Under the provisions of the above Act, advertisers requiring workmen, and whose business consists wholly or mainly of engineering or the productions of munitions of war, or substances required for the production thereof, and whose works are situated within 30 miles of London, must include in every such advertisement the words, "No person resident more than 10 miles away, or already engaged on Government work, will be engaged."

Advertisers whose works are situated more than 30 miles from London can only have their announcements inserted with the approval of the Board of Trade, who will allocate to each advertisement a box number, and collect and distribute to the advertiser all replies received. The necessary forms of application can be obtained from any Labour Exchange or from the offices of this paper, and each advertisement must contain a clear reference to the effect that no person already engaged on Government work need apply.

## MOTOR CYCLES FOR SALE.

## Coventry Eagle.

**C**OVENTRY Eagle, not done 100 miles; £30.—Warren's, 386, Euston Rd. Museum 3081. [2832]

## Dalm.

**D**ALM, 2-stroke, 1915, 3 speeds, clutch, etc., nearly new; £23.—11, Luna Rd., Thornton Heath, S.E. [2867]

## Dayton.

**D**AYTON, 1½ h.p., 2-stroke; £16/10, bargain; what offers?—62, Knighton Park, Sydenham. [2588]

## Dene.

**D**ENE-PRECISION Combination, 8 h.p., 3 speeds, lamps, mirror, speedometer, watch, spares, all tyres new; £60; exchange Ford, cash adjustment, or take less power part payment.—Galley, New Washington, Co. Durham. [2574]

## Douglas.

**19**15 Douglas, 3-speed; £45.—Warren's, 386, Euston Rd. Museum 3081. [2836]

**19**13 Douglas, fully equipped; £32.—Warren's, 386, Euston Rd. Museum 3081. [2834]

**19**14 Douglas, T.T. lamps, etc.; £35.—Warren's, 386, Euston Rd. Museum 3081. [2835]

**P**ETROL Free with 1911-12 T.T. Douglas; 16 gns.—Troward, 78, High St., Hampstead. [2745]

**D**OUGLAS, 1913½, 2½ h.p., 2-speed, kick-starter, new condition; £32.—29, St. Leonards St., Bow. [2694]

**19**14 2½ h.p. Douglas, 2-speed; a bargain; must sell; £27/10.—11, Sussex Rd., South Croydon. [2601]

**D**OUGLAS, 1911-12, 2-speed, clutch, just overhauled; £22, or offer.—12, Ivy Lane, Brockley, S.E. [2662]

**D**OUGLAS, 1911, good tyres, in first-class order and condition; £12.—455, York Rd., Wandsworth. [2781]

**19**14 Douglas, 2½ h.p., clutch, starter, 2 speeds, new back tyre; £35.—L2,265, c/o The Motor Cycle. [2900]

**D**OUGLAS, 2½ h.p., first to view will purchase; £15, no offers.—14, Dodbrooke Rd., West Norwood. [1541]

**D**OUGLAS, 1915, 2-speed, new condition, with accessories; £45.—Pickering, Mardol, Shrewsbury. [X8239]

**L**ATE 1913 Douglas, 2½ h.p., 2-speed, clutch, lamps, and spares; £50.—Bavono, Farnborough Rd., Farnborough, Hants. [2564]

**D**OUGLAS, 1914, 2½ h.p., 2-speed, and clutch, lamps and speedometer, all like new; £37/10.—455, York Rd., Wandsworth. [2779]

**19**15 Douglas, 2½ h.p., 2-speed, T.T. model, fully equipped; £44; exchanges.—Newham, 223, Hammersmith Rd., W. [2821]

**2** h.p. Douglas, 1911 model, single speed, very powerful and fast; £17/10, guaranteed.—Wauchope's, 9, Shoe Lane, London. [2708]

**19**13 T.T. 2-speed Douglas and accessories, in perfect condition; £30; seen any time.—Bounds, Garage, 223, High Rd., Kilburn. [2628]

**19**15 T.T. 3-speed Douglas, in perfect condition, and accessories; £42/10; seen any time.—Bounds, Garage, 223, High Rd., Kilburn. [2628a]

**D**OUGLAS, 2-speed, kick-starter, clutch, hardly used, condition perfect throughout, all accessories; trial; £36.—16, Camden Rd., Wanstead. [2766]

**D**OUGLAS, new, latest pattern, 2½ h.p. models for immediate delivery including War Office black Douglas.—Moffat, Yeovil. Tel.: 50. [5855]

**D**OUGLAS 1913 2½ h.p., 2-speed, T.T., just overhauled, new pistons, tank re-camelled, new lamps; £35.—Railway Garage, Staines. [2890]

**19**13 Douglas, 2½ h.p., 2-speed, complete with lamp, horn, speedometer, etc., just overhauled; £30.—G. Blanchard, 3, Blenheim Mount, Bradford. [X8578]

**2** h.p. Douglas, late 1913, clutch model, accessories, good condition, recently overhauled, tyres new; £34.—89, Richmond Rd., Kingston-on-Thames. [2774]

**D**OUGLAS Douglas, Douglas, all models in stock, 2½ h.p. and 4 h.p., 1911, 1912, 1913, 1914, 1915, and 1916; £15 to £55.—6, Warren St., London. [2808]

**D**OUGLAS Specialists.—Gibb, Gough, London Rd., Gloucester. Gibb, the International Douglas rider, winner of numerous cups and gold medals. [2218]

**D**OUGLAS, 1914, 2½ h.p., model W, clutch, kick, lamps, accessories, excellent condition; no examination; £38.—12, Osbaldeston Rd., Stoke Newington. [2891]

**2** h.p. Douglas, kick-start model and 2-speed gear and free engine, complete with accessories; £37/10; guaranteed.—Wauchope's, 9, Shoe Lane, London. [2704]

**D**OUGLAS, 1914, 2½ h.p., 2-speed, kick-start, clutch, just overhauled, tyres and belt practically new; 40 gns., or nearest offer.—Heys, Redwood, Kenley, Surrey. [2864]

**M**OTOR Cycle For Sale, Douglas 2½ h.p., 2-speed, new September, 1914; owner ordered France; excellent condition; £35.—Housekeeper, 56, Victoria St., Westminster. [2307]

**C**OLMORE Depot, Birmingham, Manchester, Leicester, and Liverpool, have in stock complete range of all models Douglas for immediate delivery, also full range of spares. [0800]

## The British Magneto. A Three Years' Campaign by "The Motor Cycle."

IT was in 1913 that *The Autocar* had the boldness to point out that the British motor industry was, to all intents and purposes, solely reliant upon German-made magnetos, and that a complete dislocation of its trade might ensue were a strike or riot to occur at Stuttgart. The matter was also ventilated in *The Motor Cycle*. At that time it was little thought that the warning was destined to prove prophetic. As a result of such a bold exposure it is hardly necessary to mention that we came in for a considerable amount of abuse from German agents and other interested parties, but having exposed the position we felt that our object was temporarily achieved. We thus proved once again our genuine concern for the welfare of British trade and the desirability that our home motor industry should be entirely self-supporting.

Then, in 1914, when this country was driven into a great war—which England least of all wanted—we lost no time in urging the desirability of manufacturers at home seizing the opportunity and building up a magneto industry in this country. From time to time we have outlined the manufacturing position in our endeavours to foster the British magneto, and have laid our pages open for a recital of the facts by the different firms who were quick to act upon our suggestions. Observant readers of this journal will recall that, whereas at the commencement of war there were but two or three firms in this country producing magnetos in a small way, the number has grown until there are now a dozen or so firms actually producing or about to produce magnetos in quantities. We have never ceased to keep in mind and to urge the desirability of producing entirely in this country all our requirements in respect of magnetos, and during our campaign spread over the

last *three* years—that is, from a time before the war commenced—we have published criticisms and results of experience, with the sole object of encouraging the home-produced article. We have had to expose the unaccountable lukewarmness of certain British motor manufacturers who, up till a few months ago at any rate, were by no means determined to stamp out the enemy-made article and to support home industries. Such strange lack of patriotic interest is, fortunately, isolated, but nevertheless we are sorry to say that it does, or did, exist.

So far as *The Motor Cycle* is concerned, we have given a lead and openly stated our position, which is, "that in accord with the recommendations agreed upon at the Paris Economic Conference, we will not permit the advertisements of new goods manufactured in enemy countries to appear in this publication, either during or after the war."

### Time for Manufacturers to Act.

Looking back over our efforts and the amount of space devoted to the fostering of the British magneto industry, we must say we feel that, had a little more enthusiasm been exhibited in manufacturing circles, and particularly by the Motor Cycle Manufacturers' Union, the result would have been a good deal more advanced than is actually the case. For instance, neither individually nor as a body have the British motor cycle manufacturers expressed their determination not to use foreign magnetos after the war. For all the public know they intend to "wait and see." Still, Rome was not built in a day, and we feel confident, from the amount of preparatory work which has already been done, that ere long British industry and British capital will be well able to satisfy all the needs of the trade, and that the motor cycle makers will recognise this. In addition to what we have openly published, we keep in mind all the time this particular object, among others, and behind the scenes are working towards its accomplishment.

THE Nottingham and District M.C.C. last week arranged another hill-climbing expedition in the Peak District. Members were apprised of the event by the hon. secretary, Mr. W. W. Weldon, who suggested to members that they should bring with them their passengers and luncheon baskets. A start was made from the Market Place, Nottingham, and the party met at Matlock, first visiting the scene of the last exploit, a stony, winding track of about 1 in 4 to the left of the road entering Matlock Bath. On the present occasion members were to be introduced to two comparatively unknown hills in the Darley Dale district. The pilot should have been Mr. I. Cohen, the designer of the Sturmev-Archer gear, who spends his week-ends in search of "impossible" climbs testing the invention for which he is responsible.

Unfortunately, the previous day he broke the special piston of his 4 h.p. Norton, and spent the morning of the event fitting another which had to be jury-rigged. Consequently, when he joined the party later his sidecar machine did not show up so conspicuously as it usually does.

First a hill was tackled to the left of the Matlock-Bakewell main road leading from Birchover. The surface is simply a mass of loose boulders, and there is quite a long stretch of single figure gradient approximating 1 in 5 or 6 in places.

A 4 h.p. Champion-Jap sidecar, piloted by W. W. Weldon, made a very creditable show, going up

comparatively easily after shedding the passenger half-way up—no mean performance. Cohen's Norton sidecar, though buffeted about on the boulders, stuck to its guns, but the other members of the party, with the exception of a rider of a W.D. model Triumph, had too much respect for their machines—and wisely refrained. From the summit of this hill a corresponding rise on the opposite side of the valley was observed. Closer investigation, however, proved it to be a mere footpath leading from a disused lead mine, only fit for motor bicycles. The Triumph rider, reconnoitring for the party, made a clean ascent at the first time of asking, despite two stone ridges six inches high and a thirty yards pitch roughly measured at 1 in 3.

After lunch a move was made to Darley Dale, and

a right-hand turn taken, leading to the inevitable lane of ruts covered with loose stones, winding hither and thither, which, after a culminating pitch of atrocious surface, crosses two fields, when it joins the summit of Rowsley Toll Bar Hill. All the bunch, including Standard and G.W.K. light cars, started in single file. First an aged Bradbury knocked out after a plucky attempt; the 4 h.p. Champion-Jap plugged away until obliged to shed its passenger, when the remainder was accomplished in good style; J. Richards, on a 6 h.p. Abingdon King Dick, shattered his driving pulley on a steep stretch; Cohen's engine stopped with the piston almost seizing; and Dr. Mackay, on the

I. Cohen, the designer of the Sturmev-Archer three-speed gear, on his Norton sidecar.

(1) W. W. Weldon on his 4 h.p. twin Campion sidecar. Observe the rough surface.

(2) A W.D. model Triumph on a stretch of 1-4 gradient near Birchover.

(3) Interested spectators of a single-cylinder sidecar which made a good climb.

G.W.K., came to a standstill—not because of lack of engine power, but because grease got on to the friction discs. The Triumph solo mount went up with plenty of power in hand, but a Harley-Davidson sidecar was evidently overgeared or out of tune, for it was reported stopped quite early.

All these hills were more than sufficient to keep the participants busy, but none would be fit for a reliability trial when those happy days return. Getting down two of the hills was a far worse ordeal than climbing them.

The lessons of the day were that gradient alone cannot stop the modern three-speed motor bicycle. Where it is possible for the tyre to obtain a grip at all, and also, incidentally, for the

rider to retain his seat in the saddle, the present-day motor cycle may be relied upon to succeed every time. Another point demonstrated was the uselessness of a foot-operated clutch on rough surfaces. Boulders constantly threw machines out of their path, and only by the rider steadying himself with his foot and easing the hand-controlled clutch could the ascent be continued successfully.

### Magneto Details.

British magnetos are certainly making good, and on the whole I have had a very good time with those that come my way. As one might expect, the smallest details are those which cause trouble. The condensers have been an occasional source of worry, from all one hears; the rocker arms are still apt to stick up, and we have yet to manufacture unbreakable high-tension brushes. In all points our baby industry seems to have caught up the long start which we foolishly allowed Herr Bosch to snatch; and I have good hopes that, when the war is over, we shall see a British magneto with a rocker arm which *cannot* stick up—an innovation which will save practised riders much annoyance, and protect tyros from straining their hearts and bursting the ganglion which controls the swear nerve.

### Paraffin the Culprit?

There are not many motor cyclists left in England nowadays, and I was the more astonished to find several smashed engines decorating the repair bench of quite a small provincial garage last week. The manager and their several owners all ascribed the smashes to heavy fuels, and I was rather surprised to hear that a large proportion of the broken pistons, etc., had been sustained in starting up. In some cases starting had been eased by heavy priming with petrol, in others by filling the carburetter. The explanation appears to be that imperfectly burnt fuel leaves residues which wash away the oil from between the piston and cylinder in particular, exerting a similar but weaker effect on bearing surfaces lower down in the engine. Heavy priming emphasises the trouble, and when an explosion occurs things begin to happen. The special danger at starting is due to the fact that the congealed oil in the crank case is not flung up on the cylinder walls, as the flywheel is moving slowly; and the oil is too cold to spray up into a mist. It is certain that many owners are eking out their petrol ration with heavy fuel, without supplying the extra heat and special mechanical vaporisers essential to adequate combustion of these sluggish oils, and without increasing their lubrication. Complete advice on the subject has appeared in these columns.

### Overheated Plugs.

Messrs. J. A. Prestwich remind me, anent the above topic, of some sparking plug tests which they carried out in 1915 (see *The Motor Cycle* for March 18th in that year). Seven plugs were tested on an 8 h.p. J.A.P. engine, running on the bench, coupled to a Froude dynamometer. Six of them evinced loss of power almost as soon as the engine reached the test speed of 2,000 r.p.m. (a speed often exceeded by modern engines), and the firing became bad enough to cause absolute stoppage in periods varying from twenty seconds to 5½ minutes. The most peculiar running was obtained with a "pepper-box" type of

plug, the sparking points being enclosed in a perforated cap; this missed an explosion or two, cooled down a trifle in the process, and then restarted firing. A plug with an externally adjustable gap produced no increase of efficiency. Finally, a plug with soundly designed cooling showed itself equal to ten minutes of heavy load at 2,000 r.p.m. Messrs. Prestwich support my contention that inferior plugs often cause knocking, overheating, and seizure on air-cooled engines, and they consider that a short-reach plug with substantial electrodes and good conductivity is essential.

### Twin-cylinder Inlet Pipes.

It is questionable whether the inlet pipe of the average twin-cylinder is yet as perfect as it should be. When the pipe is dismantled for decarbonisation purposes, it is often necessary to swathe the joints in insulating tape to eliminate air leaks, and fastidious riders dislike this untidy practice. In car practice, flat flange joints are bolted up against a lead washer, but on motor cycles this method is not common, partly because a carburetter so mounted is apt to project across the off side foot support, partly because the bolts can hardly be big enough to accept heavy spanner work. Nevertheless, it is clear that the average circular flange with an enveloping nut is not easy to register, and very apt to leak. Has anybody got a special word of praise for any maker's dodges in this respect?

### Maltreating an A.B.C.

Mr. Granville Bradshaw, the designer of the A.B.C., when he delivered my machine, defied me to make it konk by any means except under-lubrication. Last week I found myself in a district where narrow, steep lanes abounded, and the conditions seemed ideal for trying for that elusive konk. I had to pay about eight visits, entailing a total run of sixteen miles over routes including plenty of single figure gradients, and as I had only to stop a minute at each house the test seemed promising. I traversed the entire distance on the second gear of 9½ to 1; I took it as fast as possible, the speedometer frequently recording just over 40 m.p.h. uphill; and I kept the engine running downhill as well as up. At the finish of the test I had not elicited a single konk, and though I could not hold my hand on the cylinders, I could put it there without withdrawing it too hurriedly. Immediately after the run I took the machine out on a deserted stretch of road, and it promptly ran up to its maximum pace of 65 m.p.h. for a mile, after which it negotiated a cornersome hill on third gear (5½ to 1) without konking. This looks as if there was something in steel cylinders and overhead exhaust valves, eh? At any rate, I have never owned a machine which would not grumble under such maltreatment. It would be interesting to know if Capt. Lindsay's T.T. Norton would perform such a test.

# Along the Yorkshire Coast

THE FOLLOWING NOTES OF A RUN ALONG THE YORKSHIRE COAST, UNDERTAKEN PRIOR TO THE OUTBREAK OF THE WAR, WILL BE READ WITH INTEREST BY MANY, PARTICULARLY MOTOR CYCLISTS, BY REASON OF THE FACT THAT SOME OF THE PLACES REFERRED TO ARE FOR MILITARY REASONS AT PRESENT INACCESSIBLE TO THE ORDINARY TOURIST.

FOR quite a long time it had been my ambition to cover the whole of the Yorkshire coast line, from Selby as a starting point, and to include the lower reaches of the River Ouse and Humber.

An opportunity presented itself last autumn, so early one bright crisp morning I picked up my passenger "Billy," and we set off in good spirits, soon covering the short distance necessary before reaching Selby, where I filled the tanks while B. had a look round the fine old abbey.

We left Selby by the York Road, and crossed over the Ouse by means of a disgraceful old wooden structure called the Toll Bridge. Fancy, in this enlightened age, having to pay a toll of  $3\frac{1}{2}$ d. for a motor cycle and sidecar to cross a bridge on the main London-York road. This is undoubtedly one of the objects to which the proper authorities might attend.

Once safely over the bridge, there is a good example of how this little town is developing, for on our right we noticed a number of large new manufacturing works producing soap and tar. We soon left these behind, and entered the village of Barlby, where we turned right for Hull. With an exception mentioned later no one can very well go wrong, as the signposts are good and numerous.

At Hemingborough we pulled up and spent a little time visiting the curious old church, the spire of which can be seen for miles around. About a couple of miles further on we noticed the ruins of Wressle Castle away

on our left, and then we had to pay another  $3\frac{1}{2}$ d. to cross the River Derwent by means of a dilapidated wooden structure named "The Loftsholme Bridge." By the way, motor cycles ridden solo have to pay 3d. toll both here and at Selby.

## Some Quaint Inscriptions.

At this bridge we deviated from the main route and we took the first turn to the left to visit Wressle Castle, which was of importance during the Civil Wars. The ancient building, however, is woefully unpicturesque and of sombre aspect. Disappointed, we retraced our tracks to our proper route at the place where we left it. A short spin brought us into Howden, where we spent a very enjoyable half-hour rambling round the Parish Church and ruins of the old St. Cuthbert's

Church, which possess some fine architectural features. There are numerous buildings of note at Howden, but these we left for another visit, and leaving the nasty cobbly streets, took a turn to the right half a mile out of the town, making for North Cave, which, like most villages in this district, owns an ancient church of more or less interest. This particular edifice is of Old English origin, and on the floor can be seen the following inscription:

"My Father, a North Briton;  
My mother, Rutlandshire;  
From Dublin I, their son,  
Hugh Montgomery, Esq.,  
When my race is run  
Shall rest me in this choir  
In hope, as he begun,  
God will raise me higher."

The A.J.S. sidecar by the old mounting stone outside Hemingborough Church.

### Along the Yorkshire Coast.—

At the top end of the village we turned right, ignored the first left turn, where a signpost points to Hull—which is the direct road, but not a very good one—and went straight forward to South Cave, a pretty place where the ancestors of the famous George Washington once resided. The village of Elloughton was next visited, and just after leaving this place a fine house called Thorpe Hall can be seen to the left. Welton is soon reached, and proves to be a very pleasing spot, especially considering that up to South Cave the roads are extremely flat and the scenery uninteresting. In the churchyard a baby was once found, and was christened Jeremiah Found. In the course of his life he was married no fewer than eight times before being laid to rest. On his tombstone is the following epitaph:

"Here lies Jeremiah Found, who has eight times married been;  
But now old age has caught him in its cage,  
And he lies under the grass so green."

From Welton we went to Melton, where William de Melton, Archbishop of York, 1317-1340, was born, and then through North Ferriby to Hessle, a suburb of Hull, and by following the tramlines, which begin shortly after leaving Hessle, we arrived in the centre of Hull, near the Wilberforce monument.

I believe it was Edward I. who first really commenced the development of Hull. When on a visit to this district he noticed that the two villages Wike and Myton, which stood where the River Hull joins the Humber, would form a fortified port. He christened these villages Kings-Town-on-Hull. Improvements were started, which eventually converted the place into a large city noted as a port, rather than for its ancient history, for which it might well claim a title to fame.

We had a look round some of the docks, and after lunch restarted on our journey, following a tramcar marked Route M, which brought us to the Hedon Road. This road is practically dead straight for five

miles. We had not gone far before a heavy rain-storm commenced, and after sheltering under a bridge for nearly an hour, we returned to Hull, where we put up for the night. Next morning turned out fine, but

The farmyard through which runs the old toll road from Withernsea to Roos.

dull, so off we set along the Hedon Road again, the surface of which was in an awful condition. We passed through the more or less interesting villages between Hedon and Skeffling, this latter village being the native place of the brothers Wright, who, together with Guy Fawkes, were executed for participation in the Gunpowder Plot. At Easington we had a look at the church and the old tithe barn, which latter is said to be the finest in England.

### Shipwrecks and Disappearing Churches.

From Easington a bad road took us to Kilnsea, where the church disappeared beneath the sea a hundred years ago. It is really the first village on the coast proper, and from this desolate spot it is only a short distance to Spurn Point. We did not take the machine to the Head, as we had no wish to get stuck in the mud and sand, so returned to Easington.

On we went through Out Newton, a little place noted for its shipwrecks, and the highest cliffs between Spurn and Flamborough, shortly arriving at Withernsea, a quiet little seaside resort. Here we had a run on the short promenade, after which we made for the village of Roos by the most direct road, which for a short stretch was in a truly fearful condition. This road continues through a farmyard, until it nearly topples over into the sea—shortly I expect to hear that, like Withernsea's old church, it has disappeared. At the present time it furnishes a good example of coast erosion, which is going on at a rapid rate in this part of Yorkshire. The toll which used to be exacted is now abolished. I understand that a new road will shortly be constructed.

Arriving at Roos, we simply followed the telegraph poles into Hornsea, passing on our way through the village of Aldbrough, where there is a rebuilt Saxon

The writer's sidecar at Loftsholme Bridge.

**Along the Yorkshire Coast.—**

church containing some fine monuments, one in particular being to Sir John de Meaux. High up above the arch of the transept is the Stone of Ulfus.

Going forward and passing through Mappleton, we soon reached Hornsea, where we caught a glimpse of the "Mere," a fine expanse of natural water, said to be the only remaining one of a number which formerly graced this district.

We took lunch at Hornsea and then endeavoured to ride on the sands for a little way, but were soon stuck deep and fast. Our united efforts were necessary to push the machine back to land; we then decided to make for Bridlington, passing through Atwick and Skipsea. On leaving this place a large grass mound can be seen, where Droge de Bruce, the first Lord of Holderness, had his castle. Two and a half miles onwards, we came to a signpost which read "To Bridlington Quay," and, by turning right and passing over the railway bridge, we soon arrived at the harbour.

yards from the road. We made all possible speed and simply flew past this objectionable sight, but obtained a bigger waft of its ozone than was altogether pleasant.

On we went through the village of Reighton, and at the same time caught a grand view of Filey Bay. Entering Filey, we crossed over the railway and straight forward until we noticed a stony hill leading to the sea. Here we turned right, then first left, along the crescent and down a very tricky and dangerous hill to the promenade. From here can be seen the Brigg, a rocky promontory jutting about half a mile into the sea, which forms the north point of the bay, and away in the distance to the south Flamborough Head is visible.

Passing the promenade, we arrived at the boat slipway, and not relishing the odd half-mile ride on the sands in order to reach the foot of the Brigg, we turned up a lovely wooded ravine, at the top of which we turned to the right and made for Scarborough. We were humming away up a long incline when we

(1) A view of the old toll road from Withernsea to Roos. The illustration gives a good idea of how the sea is encroaching on this part of the coast.

(2) General view of Runswick Bay.

(3) The only road out of Runswick Bay.

I suppose Bridlington is so well-known that it is not necessary for me to dwell on its beauties, but one must not forget that it has an old history and contains a very fine priory church and ancient gatehouse known as the Bayle Gate, both of which should be visited. Flamborough Head is near by with its beautiful cliffs and caves, its lighthouse, and fishing. The cliffs all about this point are, at certain parts of the year, the Mecca for bird egg collectors, and it is an interesting sight to see the climbers descending the cliffs in search of eggs, some of which command a very fair price. It is, perhaps, advisable to return to Bridlington and take the direct road to Filey, and this we did, and were very much disgusted to find that a refuse destructor had been recently constructed within a few

glanced down to our right and saw a splendid panorama opening out to view, so we called a halt, and from some hundreds of feet above looked down into the beautiful little Cayton Bay. Leaving this pleasing spot, we continued to the top of the hill, where we saw Scarborough in front of us, and by going straight on we soon arrived at the valley toll bridge. At this point it is advisable—unless one wishes to stop the night at Scarborough, as we did—to bear to the right and drop down to the foreshore *via* the Aquarium, then continue to the harbour and the old town and run round the Marine Drive (toll 2d.).

Scarborough I will make no attempt to describe, its natural beauty and cleanliness are too well-known.

### Along the Yorkshire Coast.—

Sufficient to say that I heartily endorse all claims put forward for the town by the advertisements. On the morrow we were up early and soon away through the village of Cloughton, where two routes offer themselves to Whitby. One of them runs to Robin Hood's Bay, near Ravenscar, but as this necessitates going down an awfully precipitous hill called Stoupe Brow and a couple of miles ride on the sands, we decided to take the alternative route *via* the moor road, which was in excellent condition.

Later in the day we took the road marked by the second signpost, and went down into Robin Hood's

half a mile out of Ellerby we took the turn to the right and made for Runswick Bay, which, in my humble opinion, is without doubt the prettiest and most picturesque village on the Yorkshire coast, and one which, seeing that it lies only a very short distance from the main road, should on no account be missed, but before dropping down into the bay it is advisable to read the notice on a signpost, "No road for motor cars." The wise will leave their machines at the hotel which stands near by and walk down the hill which leads to the sea. The gradient of the hill is not excessively severe, but the surface is bad, in two places excruciatingly so; a bad left-hand bend has also to be negotiated.

Back we went to the main road once more, and found a nasty stiff hill to drop down, which was somewhat greasy. Nearly at the bottom we had to take a very sharp right turn, pass over a narrow bridge and climb up the other side of the valley before we arrived at Easington. After leaving Loftus, for a few miles the whole aspect of the country seemed to change. Huge chimneys belched forth smoke and flame, but after climbing one or two stiff hills we left this ironstone region behind, and, bearing to the right at the end of Brotton, we dropped down to the sea once more.

The bad hairpin corner on the hill out of Runswick Bay.

Bay, which old-fashioned picturesque fishing village is well worth a visit. In order to get out of the higher reaches of the village on to the sea shore it is necessary to go down a very bad hill, and tourists with low-powered machines will be well advised to survey this hill before attempting it. We climbed out of this pretty spot, and soon joined the main road to Whitby. We entered the town by a narrow street, crossed the harbour by means of the little bridge, and ran by the side of the harbour. On the cliffs to our right a splendid view of the abbey, built in 857, is obtained, and the old church which stands close by. Both can be examined more closely by taking a walk and climbing no fewer than 199 steps. Whitby contains much of historical interest, and the town is a good centre for a number of pretty and very interesting short runs.

Afterwards we took the tortuous road to Sandsend, and had to pay a 2d. toll for doing so. Sandsend itself seems a quiet little spot, and is chiefly noted to local motorists for being the venue of Lythe Bank, a stiff and long incline which we had to negotiate in order to reach Lythe village, near which is Musgrave Castle, one of the most picturesque spots.

By following the telegraph poles no one can go wrong if he wishes to make straight for Saltburn; but

The seagulls at Staithes.

By climbing a very stiff little hill we arrived in Saltburn, where on the beach motor races used to be held between there and Redcar. The dusk was gathering quickly when we left the front to put up for the night. The run from Selby to Bridlington was somewhat uninteresting, except for its historical associations, but we were delighted with the remainder of the trip, and fully determined at a future date to take again the run from Bridlington to Redcar.

The total distance of the trip is not excessive, being only about 180 miles, but time flies quickly, and a full week-end is necessary if one wishes to visit all the places I have mentioned, which by no means exhaust the interesting spots *en route*.

*In answering this advertisement it is desirable to mention “The Motor Cycle.”*

The Dunlop Rubber Co., Ltd.,  
Birmingham,  
England.

Nairobi House,  
Sixth Avenue,  
Nairobi, B.E.A.

Dear Sirs,

*In the interests of motor cyclists generally, I think the following remarkable instance of the durability of your belts should be made known.*

*On my 4½ "B.S.A." Sidecar combination a 1-in. Dunlop belt has done 2,000 miles in six months over rotten roads in mountain country without needing to be tightened, and its ends are perfect, and the fastener is as if it were inserted to-day.*

*The astonishing thing to me is that the tension of the belt is precisely the same as it was when the belt was fitted, and I am not able to insert a shorter link in the fastener.*

*The performance is the more remarkable when you remember the disintegrating effect the equatorial sunlight has on ordinary rubber.*

*With compliments,*

*I am, dear Sirs,*

*Yours faithfully,*

(Signed) A. H. Spencer-Palmer.

**DUNLOP:** Well, the belt must have given very exceptional service to cause a man in Mr. Palmer's position to take the trouble to write us all the way from Nairobi about it.

## ANOTHER HORIZONTAL TWIN.

The Humber Co.'s entirely new 3½ h.p. air-cooled "flat" twin of 497 c.c., with three-speed countershaft gear and chain transmission.

Flywheel side of the new Humber flat twin-cylinder model.

It is a significant fact that since our articles of three weeks ago suggesting that all indications of motor cycle design pointed to the future pre-eminence of the twin-cylinder motor bicycle, we have been able to describe a new horizontal twin-cylinder opposed motor bicycle, viz., the Indian (see our last issue, pages 290-292), whilst this week we are privileged to bring before our readers still another machine with an engine of the same increasingly popular type. This latter mount is the 3½ h.p. twin-cylinder Humber, which some of our readers may have seen on the road at different times during the last eighteen months or so, during which period it has been subjected to a most thorough and searching test. Last week we examined this machine in detail, being introduced to its many attractive features by our old friend, J. F. Crundall, whose name was better known

in motor cycle circles twelve years ago than it is to-day. Crundall, as well as Sam Wright, both racing motor cyclists of old, have been largely responsible for the road testing of the machine, and were enthusiastic in their praises of this new mount.

### Mechanical Details.

From a short initial experience enjoyed subsequently, we are decidedly of the opinion that it is the finest mount the Humber Co. has yet produced. The flat twin is by no means new to this company, for goodly numbers of its 6 h.p. water-cooled model are to be seen on the road, and from all accounts are giving every satisfaction to their owners. The latest production is practically a reduced facsimile of the "six," and incorporates many of the original features embodied in the latter's design. The crankshaft is a very sturdy piece

of work of nickel steel, having bearings of exceptional size, which spell long wear, and is of the two-throw type set at 180°. In order to obtain a direct thrust on the connecting rod, thus obviating bending stress, the cylinders are staggered, as will be gathered from one of the accompanying illustrations. The bore and stroke of each cylinder are 68×68.75 mm., giving 497 c.c. A case-hardened steel camshaft formed in one with the cams is placed directly over the crank, and driven by a train of gears. Adjustable tappets with nuts of commendable dimensions are used—

Underside of gear box, showing mounting. The clutch is on the left.

Points to be noted in this view are the staggered cylinders, the pipe conveying hot air from the silencer to a jacket surrounding part of the induction pipe, the place for the starting handle above the induction pipe, and the clutch pedal at the forward end of footboard.

indeed, a feature of the new Humber is the substantial nature of the working parts. The valves are set, slightly inclined, above the cylinders, an arrangement which is essentially practical, inasmuch as it ensures perfect accessibility to these important parts.

A point which will commend itself to those of experience is the absence of valve caps, which are apt to harbour heat in a region where heat is detrimental. The cylinder, which, by the way, has numerous finely cast fins arranged horizontally, is in one piece, and the valves are removed by the Humber patented device, which allows the respective ports complete with their valves to be removed from the cylinder after a yoke securing each pair of valves has been detached. It will be gathered that the condition of the valve seating can thus be examined

(Left) The solid crankshaft. (Right) Showing the yoke holding the valves and their seatings in position.

with the greatest ease. The connecting rod is of car pattern, with an adjustable big end bearing lined with white metal, the small end having a plain phosphor-bronze bush. The pistons are of the orthodox type, with two rings situated at the top, which is flat.

The C.A.V. magneto is neatly mounted on the crank case and driven from the valve timing gear. Handle-starting is preferred, the dogs of the starting handle engaging with the camshaft, thus enabling two turns to be given to the engine by one turn of the handle. Duplicate tubes connecting the front down tube and seat tube form an excellent cradle for mounting the engine. This same cradle also acts as the support for the three-speed gear box, which is placed directly under the rear cylinder.

#### The Cylinders Quickly Detachable.

It is always a difficult matter to dispose a horizontal engine of large pattern neatly in its frame; but the Humber designers have found an excellent solution of their task, and have, moreover, overcome the objection to many flat twins, viz., the impossibility of removing the cylinders in order to decarbonise without disturbing the crank case.

Hot air jacket for induction pipe immediately above carburettor. Above is the jaw clutch for the starting handle.

Noticing the close proximity of the frame tubes to the cylinder heads, we raised this point, and at once two mechanics were requisitioned to remove the cylinder of any machine we selected while we held the watch. We preferred the rear cylinder of a machine standing in the shops, and whilst one man removed the exhaust nut and a pair of holding-down nuts on his side, the other

mechanic unscrewed the inlet flange and his pair of nuts, and, despite a minute wasted in the attempt to remove the cylinder with the piston close to the crank case, the whole operation occupied only three minutes. It was found that the cylinder would not come away until the piston had been moved to its outward position, so enabling it to be tilted. This is a tip worth remembering.

The carburettor used is a Longuemare-Hardy automatic, operated by a single lever from the right handle-bar. We proved later by road test that this carburettor provided the utmost controllability, and the by-pass arrangement permitted the engine to tick over so slowly that the explosions could almost be counted when the throttle lever was closed. The induction pipe is heated by means of a pipe from the silencer communicating with a jacket formed around the "T" piece. The silencing arrangements are particularly good, an expansion chamber of large size being placed under the front cylinder and a

pipe terminating in a further expansion chamber passing towards the rear of the machine.

#### Gear Box of Proved Merit.

The change speed gear, as we have already mentioned, gives three changes of speed, the actual ratios being 4.75, 7.88, and 13.15 to 1. The design of the box is precisely the same as on the 6 h.p. model, a single sliding

wheel (on both sides of which dog clutches are formed) effecting the various changes. The shafts are mounted on ball bearings. Six gripping surfaces are provided in the clutch, there being three plates of Ferodo, and interposed between them are two loose steel plates and two fixed end plates. The gate change speed control mechanism is attached to a lug integral with the tank tube, and a free engine position is provided between each speed. The clutch is operated by a pedal at the forward end of the right footboard (by the way, we would very much like to see the control of the clutch duplicated), and it is actuated by a plunger running through the main shaft. Ready adjustment of this plunger is provided, an opening in the chain casing having been left for the purpose of giving a slotted screw a turn as necessary. Further, the clutch itself may be adjusted quite simply and readily by giving a turn to the four nuts arranged equidistantly around the

A connecting rod of the Humber flat twin, showing adjustable big end bearing.

control of the clutch duplicated), and it is actuated by a plunger running through the main shaft. Ready adjustment of this plunger is provided, an opening in the chain casing having been left for the purpose of giving a slotted screw a turn as necessary. Further, the clutch itself may be adjusted quite simply and readily by giving a turn to the four nuts arranged equidistantly around the

Flywheel side of the new 3 1/2 h.p. horizontal twin Humber engine, which has its valves arranged above the cylinders. The hole in the transmission casing is for the plunger rod and clutch adjustment. The pedal operates the rear brake.

## Another Horizontal Twin.—

central screw. In order further to absorb any transmission jerkiness a shock absorber of efficient design is incorporated in the back wheel. The drive is against the pressure of a series of four steel springs, rubber pads further assisting to damp out the shocks. We tested the amount of "give" in this device on a wheel selected at random from a batch going through the workshops, and found that over  $\frac{1}{2}$  in. movement was possible.

## The Bicycle Fittings.

A dummy belt rim is fitted to the back wheel, and inside the V groove a fibre pad  $\frac{1}{16}$  in. in length provides ample retarding effect, and there is a rim brake operating on the front wheel. An excellent feature of the back brake is its equalising action. It is operated by a pedal at the forward end of the left foot-board.

The Humber back brake mechanism has an equalising action.

As regards the bicycle portions of the machine, there is no real departure to chronicle, but the machine nevertheless represents the soundest practice. For instance, the front guard has valances on each side extending the whole length of the guard, and a front wheel stand is provided. The rear portion of the back guard is arranged to fold upwards to facilitate tyre repairs when the puncture fiend scores a success.

After our thorough examination of the machine the engine was started by a

Diagrammatic sketch showing staggered cylinders, so arranged to enable the connecting rods to exert a direct thrust on the crankshaft.

couple of turns of the handle, and speeded up on the stand. There was a noticeable absence of vibration in the handle-bars. The engine, too, showed no sign of choking when the throttle was suddenly brought from half open to fully closed in order to bring the pilot jet into action. It cannot be stated when the  $3\frac{1}{2}$  h.p. Humber twin will be offered to the public. The machine we describe is part of a batch finished in Service colour to the order of one of the Allied Governments.

## A R.A.F. HILL-CLIMB.

### A Sporting and Well-organised Event held by Aircraft Workers. (Photographs on page 316.)

ON Saturday afternoon last, the B and E departments of the Royal Aircraft Factory held a sporting hill-climb on the steep ascent leading to Newlands Corner. Altogether, there were some twenty machines competing, but as there were six classes the event took some little time to run off.

Since all the machines were owned by young and enthusiastic engineers, there were several ingenious fittings, which are well worthy of mention. There was the  $2\frac{3}{4}$  h.p. Douglas owned by our old friend and colleague Sec. Lt. H. D. Teage, R.F.C. (T.), which had the valve stems neatly enclosed by tubular protectors, but not so neatly as those on Folland's Enfield, of which the workmanship showed no small amount of skill. Davey's Norton, one of the fastest of the competing motor bicycles, was fitted with an auxiliary oil tank behind the saddle tube, and provided with a pressure pump which delivered the lubricant through a sight feed fixed to the side of the main tank. We also noticed a Triumph and a Bradbury, both ingeniously fitted with well-made hot air jackets to their inlet pipes, kept warm by the exhaust gases.

## The Course.

The hill on the north side of Newlands Corner has an excellent surface, and on Saturday it was quite dustless. It begins with a steep pitch of 1 in 12 or thereabouts, which eases down to about 1 in 15. Competitors were timed over a course about half a mile in length. The weather was fine, though there was a high south-westerly wind, which blew across the road, and the rain held off. The event, which was timed to begin at 2 p.m., was rather late in starting, but once started it was well run off and well organised.

The competitors, all novices as regards competitions, rode well on the whole, but many changed up too soon.

## The Results.

In CLASS I., FOR MOTOR BICYCLES WITH ENGINES NOT EXCEEDING 350 c.c., there was no incident save the failure of one competitor and the effort of the rider of the smallest machine entered to change into top gear on the steepest part of the hill.

	Weight, m/c. & rider.	Fig. of merit.
S. J. Garratt (2½ Triumph)	225 294 74	4190
H. Elvidge (2½ Imperial)	292 273 63½	4350
R. Page (2½ O.K.)	180 280 87½	4390

In CLASS II., FOR MACHINES WITH ENGINES NOT EXCEEDING 500 c.c., there was, of course, greater speed, and it was of more interest to watch. English made a good performance, though he rode with his stand trailing on the road.

P. Davey (3½ Norton)	490 329 41½	2590
J. English (2½ Douglas)	347 280 51½	3320
D. Turner (3½ Rover)	499 322 47	3420

CLASS III. WAS FOR MACHINES WITH ENGINES NOT EXCEEDING 750 c.c. There was nothing to record as regards the performances in this class except to point out that the Norton passed us travelling at a good speed.

T. P. Mears (5 Ivy)	670 414 35½	2050
F. G. Kennard (4 Bradbury)	554 305.5 38½	2360
J. English (2½ Douglas)	347 280 47½	2920

CLASS IV., FOR MACHINES WITH ENGINES NOT EXCEEDING 1,000 c.c. In this class and also in Class III. Mears's Ivy, though travelling well, wobbled badly. His progress near the finish was somewhat

impeded by a Ford car. It will be seen that the Norton again distinguished itself.

P. Davey (3½ Norton)	490 329 41½	2600
F. G. Kennard (4 Bradbury)	554 305.5 38½	2700
D. Turner (3½ Rover)	499 322 44	3000

Unlike the previous classes, which were run on The Motor Cycle formula CLASS V. WAS DECIDED ON TIME ALONE.

T. P. Mears (5 Ivy)	670 — 35½ —
F. G. Kennard (4 Bradbury)	554 — 36 —
M. Baseden (8 Matchless)	964 — 39 —

It will be noted that Mears's Ivy made the same speed as in Class III.

The last event to be run off was CLASS VI., FOR SIDECAR MACHINES.

T. P. Mears (5 Ivy)	670 644 52½	2900
F. G. Kennard (4 Bradbury)	554 535.5 62½	4320
H. G. Clark (3½ Triumph)	490 573 76	5020

Mr. W. E. Wickham, the secretary of the meeting, deserves congratulations on its conduct, while the smartness with which he worked out the formula results earned our most sincere gratitude.

## AVERAGE PRICES.

SPECIAL  
FEATURES

ANOTHER HORIZONTAL TWIN (illus.)  
ALONG THE YORKSHIRE COAST (illus.)  
HILL-CLIMBING COMPETITIONS.

## The "Lightwin"

Is the Hendee Manufacturing Co.'s name for their new horizontal twin-cylinder machine that was fully described in the last issue of *The Motor Cycle*.

## The 6 Cwt. Light Car.

Motor cyclists interested in small, light four-wheelers should read the description of the Jackson twin-cylinder two-stroke light car in yesterday's (Wednesday) issue of *The Light Car*. The illustrations show the great simplicity of the design, and its weight (6 cwt.) is no more than some of the more powerful sidecars.

## Some Shell Charges.

As from January 1st, 1917, Shell motor spirit and other Shell petroleum products will be handled in this country by the Shell Marketing Co., Ltd., which has been established, and which will be controlled, by Shell Royal Dutch interests. The British Petroleum Co.'s contract as distributing agents for Shell spirit lapses with the year 1916.

## Adulterated Petrol.

A reader states, on the authority of a doctor of science, that the method of testing petrol to ascertain the presence of paraffin, suggested by a correspondent a fortnight ago, is quite useless, for the only meniscus or dividing line will be between the nitric acid and the mixture, which latter will not be separated into its component parts of petrol and paraffin.

## Discrimination in Petrol Allowance.

We are informed by a commercial traveller that special treatment is now being accorded to those who use their machines for professional purposes. In some cases as much as ten gallons per month is being allowed. Our correspondent is receiving six gallons for October. We should advise other riders similarly situated to write for a supplementary licence.

## A Passenger for the Sidecar.

A Birmingham reader, who uses a sidecar outfit every day in his business, his mileage averaging about 250 miles per week, has throughout the summer adopted an excellent plan that might be followed by others for giving trips to convalescent soldiers. On business trips he had previously travelled alone, but now he seldom starts out on a day or half day's run without calling for a soldier from a neighbouring hospital. This plan has proved very successful, and has been greatly appreciated by the men, and also the commandant of the hospital.

## The Second-hand Show.

The promoters of the show of second-hand cars and motor cycles to be held at the Royal Agricultural Hall, from November 10th to 18th next, tell us that the bulk of the exhibits in the cycle section will be owned by men about to join the army.

## A Philipson Pulley Development.

Our last instalment of patent abridgments included a new edition of the Philipson pulley. The publication of this has resulted in a great deal of correspondence for the makers, Philipson and Co., of Bolton, and they ask us to point out that this particular design is only suitable for cycle cars.

## An Uncommon Record.

Two American riders recently made what might be termed a record hill-climb, or altitude record. The performance was the scaling of Mount Hood to a height of 9,000 feet, the machines travelling the entire distance by their own power. Leaving the camp at the base, they began their climb with the crust of snow bearing them up in fine shape. Occasionally, as the grade steepened and the sun gained power, the machines and riders were buried in the snow. The previous motor cycle record up Mount Hood was made in 1914 by Axel Kildow, who climbed 7,000 feet. The machines used were the Indian Powerplus models.

TESTING R.F.C. P. AND M's AT BROOKLANDS, AND INCIDENTALLY ILLUSTRATING THEIR EASE OF STEERING.  
Riding hands off with a passenger on the carrier is a particularly "ticklish" undertaking.

## A Zepp. Warning

brings out a swarm of Airmen, Cyclist-soldiers, and Special Constables, whose object is to save life.

Many a motor cyclist's life has been saved by the simple precaution of equipping his machine with

## Bates British-built Tyres

Be warned against the use of cheaper tyres, which are less safe because they are less scientifically constructed, and consequently more prone to skid. The growing popularity of Bates Tyres, and the consequent increased output, have enabled us to reduce prices, in spite of increased cost of material. Lose no time in taking advantage of the reduction.

**British Motor Cycles in Favour.**

A leading German General bemoans the fact that the German Army possesses no motor cycles like the British Army.

**Flat Twins.**

Following upon the exclusive illustrated description of the horizontal Indian which appeared in our last issue, we describe and illustrate this week another new flat twin, viz., the  $3\frac{1}{2}$  h.p. air-cooled Humber.

**More Petrol.**

We announced in our last issue that, instead of half a gallon a week, four gallons of petrol per month will be obtainable by motor cyclists after November 1st.

**Send in your Petrol Application Now.**

General satisfaction has been expressed by the official announcement of the Petrol Control Committee of increased petrol supplies commencing November 1st. Details were given on page 294 of our last issue, so that it only remains for us to remind readers to fill in the forms at the back of their existing licences and send them to 19, Berkeley Street, London, W., for new licences for the five months commencing November 1st.

**The National Relief Funds.**

At the week-end the principal war funds stood as follow:

The Prince of Wales Fund (£3,468,925 distributed) ..	£5,962,907	0	0
The Queen's Work for Women Fund .. .. .	170,779	7	6
British Red Cross Fund ..	4,460,653	0	0
Tobacco Fund .. .. .	115,263	0	0
Kitchener Memorial Fund ..	323,000	0	0
Belgian Relief Fund .. ..	2,020,000	0	0

**British Tyre Exports.**

Even if British motor cycles cannot be produced in sufficient quantities to satisfy a portion of the Overseas demand, our tyre manufacturers are going ahead with exports by leaps and bounds. Tyres certainly seem an instance where enemy trade has been definitely captured. The total exports of motor tyres for September alone was £141,569, and cycle tyres £42,096 = £183,665.

**Week-end Events in this Issue.**

Following our usual practice, week-end motor cycle events are described and illustrated in this issue. A hill-climb, organised by employees of the Royal Aircraft Factory, and a Motor Volunteer inspection were among the important events of the week-end. Readers of *The Motor Cycle* may read accounts of the proceedings a week in advance of other journals.

**Coventry Premier Ltd. Report.**

The directors of the Coventry Premier, Ltd., in presenting the accounts for the nine months ending 31st August, 1916, say that owing to the war it has been impossible to obtain the audited accounts of the company's Continental business for the period now under review. It must be borne in mind that the English side of the business has had to bear a large amount of expenses which otherwise would be borne by the business as a whole. The result shown on the Profit and Loss account is a profit for the period of £1,737 8s. This profit reduces the adverse balance to £61,486 18s. 6d.

**A Successful Wounded Soldiers' Outing.**

Mr. Stephen M. Crouch, of Wanstead, who recently organised a wounded soldiers' outing, kindly acknowledges our small assistance as follows: "The short paragraph you were good enough to insert on the subject of the outing for wounded soldiers in the West Ham Hospital enabled me to organise a successful outing, which took place on Saturday, the 30th ult. Nineteen patients were picked up from the West Ham Hospital on that day and given a run, via Chigwell, Abridge, and Theydon Bois, to the King's Oak Hotel at High Beech, where high tea was provided and a few of the voluntary helpers assisted with a short musical programme. The return journey was made to the hospital via Loughton and Woodford."

**Points of Indian 1917 Models.**

Last week we described the 1917 model Indian motor cycles, and we have since received a communication from Mr. W. H. Wells (who is at present at the works at Springfield, Mass.), in which he draws particular attention to one or two interesting features of the new models, which will appeal to Britishers. It will be recalled that the Powerplus model has twin tanks, and each compartment holds one and a half Imperial gallons. Incorporated with the reinforced frame head is a  $\frac{3}{4}$  in. eye-bolt hole for sidecar front main connection. Although the illustration of the complete machine shows the kick-starter on the left-hand side, the British models will have it fitted on the right-hand side as heretofore. The real novelty of the Indian range, viz., the

flat twin featherweight (they call it the Lightwin in America), is not likely to be seen in this country for some time yet, and when it does appear it is probable that its specification will be somewhat amended by Mr. Oscar Hedstrom, the designer. Mr. Wells says that the business outlook in the States is good.

**Motor Cyclist Volunteers.**

Mr. A. E. Beard writes stating that there are vacancies in the Motor Cycle Sections of the National Motor Volunteers, Blackburn Squadron. For full particulars apply to A. E. Beard, Mill Hill Blackburn, and for the Darwen Squadrons apply to J. Martin, Fantoft, Darwen.

**Manufacturers and German Magnetos.**

Astonishment is expressed in our leading article this week that the Motor Cycle Manufacturers' Union has yet done nothing publicly to stamp out the German magneto and so encourage British magneto makers to persevere and capture entirely this important trade hitherto held by the enemy.

**A Douglas Improvement.**

In our "Patents" column we show a new method of sidecar suspension patented by Mr. W. Douglas. It will be remembered that the 4 h.p. Douglas motor cycle can be supplied with an ingenious spring frame, and now that the Douglas people have gone one further and suspended all three wheels, and the even running of the big horizontal engine is considered, one cannot but conclude that the combination should prove one of the most attractive ever designed.

DESPATCH RIDERS AT WORK AND PLAY AT A HOME TRAINING CENTRE.

Revolver practice forms an important part of a D.R.'s training, and the upper view shows a batch of men at a range. (At left) In some spare moments a few of the men so rigged up the M.M.G.S. outfit illustrated! The sidecar body was removed from a  $3\frac{1}{2}$  h.p. twin Zenith outfit and an ancient cannon piece substituted.

## RECREATION FOR AIRCRAFT WORKERS.

WINNERS OF SATURDAY'S R.A.F.  
HILL-CLIMB,  
a report of which appears on page 313  
of this issue.

- (1) At the start. (2) T. P. Mears (5 h.p. Ivy), winner of three events. (3) P. Davey (3½ h.p. Norton). (4) S. J. Garratt (Junior Triumph). (5) F. C. Kennard (4 h.p. Bradbury). (6) T. P. Mears with sidecar attached to his Ivy. Mears was the star performer of the day.

## LONDON MOTOR CYCLIST VOLUNTEERS ON PARADE. Inspection of the N.M.V.

A VERY imposing gathering of the National Motor Volunteers formed part of the big inspection of Volunteers held in London and the Western districts last Saturday afternoon. The N.M.V., of which the motor cycle section is an important part, was inspected by Maj.-

Gen. Sir Francis Lloyd, and in the topmost picture he is shown inspecting the motor cyclists.

The N.M.V. met in Eaton Square, where two of these pictures were taken, and the cars and motor cycles were then sent on to the Wellington Barracks, where the inspection took place. The task of arranging for the inspection of such a huge fleet of

The gathering in Eaton Square.

cars, ambulances, bicycles, and sidecars, was no easy matter, and reflected great credit on Commandant F. Doland, the section being under the command of Maj.-Gen. D. C. F. Macintyre, C.B. Last week-end was memorable for Volunteers.

At the top Maj.-Gen. Sir Francis Lloyd is seen inspecting motor cyclists of the N.M.V. at Wellington Barracks. The two centre views were taken in Eaton Square, where the National Motor Volunteers foregathered prior to the inspection. The bottom view shows some motor cyclists ready for inspection, with the ambulance section in the background.

The 1917 model  $2\frac{1}{2}$  h.p. two-stroke two-speed Excelsior. It has chain and belt drive and no clutch.

### COVENTRY EXCELSIOR LIGHTWEIGHT.

FOR some little time past, Bayliss, Thomas, and Co., makers of the Coventry Excelsior machines, have been paying considerable attention to two-stroke models, and many have been sold both at home and abroad. The model illustrated is one of two standardised for 1917. This is the  $2\frac{1}{2}$  h.p. Peco-engined mount, the other being fitted with a  $2\frac{3}{4}$  h.p. Peco engine. Both are fitted with chain-cum-belt drive and Albion two-speed gear. The lower powered one is essentially a solo mount, but the  $2\frac{3}{4}$  h.p. can well take a light sidecar, and the pages of *The Motor Cycle* have chronicled the hill-climbing exploits of the little  $2\frac{3}{4}$  h.p. Excelsior sidecar. The light coachbuilt sidecar is enamelled and lined to match the bicycle, and is well sprung and upholstered.

The makers of the Coventry Excelsior are well known for their medium and high-powered machines, and it is just as well to mention that they will be continued for next year.

### ABOARD A "TANK."

#### Experiences of One of the Crew.

THE sensations experienced in action by a member of the crew of a "tank" are described by a wounded soldier now in hospital at Salford. In an interview with a *Daily Despatch* representative the soldier said: "It is not easy to describe my feelings as I sat inside at my gun while the strange monster slid down one side of the shell hole and slowly crawled up the other, until at last we were astride of the enemy's trenches. The waiting for the order to move was the worst sensation. When we got moving and began firing the excitement of the battle kept our senses alert.

"The motion of a 'tank' I can liken to nothing better than being on a stormy sea in a very poor sailing vessel. We felt quite safe inside the car. The Germans tried hard enough with their artillery, but the men in the trenches we were attacking were too demoralised by our strange appearance to do much.

"When we had done our bit the infantry came along and cleared out the trenches and dug-outs. It was a

pandemonium while it lasted, with the rattle of machine guns and bursting shrapnel about us.

"How was I wounded? Well, after our work was done, several of us left the machine to see how it had stood the strain, and also to render first-aid to our wounded. It was so hot in the car that I had taken off my helmet, and I had just picked up and put on a German shrapnel helmet—a thing like a small shallow barrel—when a piece of shrapnel came along and caught me on the right side of the head."

#### Will the "Tanks" be Filmed Publicly?

We understand that Lt. G. Malins, who has been responsible for obtaining front line pictures, has returned to England with a second series, which includes the great attack on Martinpuich, the Brigade of Guards in action, and the bombardment of the German lines. Provided these pictures are issued to the public, a portion of the film which will be of special interest to motorists will be that showing the "tanks" in action. We hope that in the near future the public may see pictures of the "tanks."

#### A Suggestive Comment.

An officer attached to the Heavy Section Machine Gun Corps, the section equipped with the heavy armoured cars, writes from the Front: "No doubt you have read in the daily press the stories of the 'tanks.' Some of them are true!"

### IMPORTS AND EXPORTS.

THE cessation of the importation of motor cycles into this country, first indicated in the July Board of Trade returns, applies to the returns for September just issued. Exports, unlike trade generally, show a large decrease compared with the previous month, though an increase compared with the corresponding period of last year. Following are the actual figures:

	IMPORTS.		
	Sept., 1916.	Aug., 1916.	Sept., 1915.
Number ...	—	—	437
Value, complete machines ...	—	—	£20,859
Value, tyres and parts ...	£9,215	£8,182	£9,267

	EXPORTS.		
	Sept., 1916.	Aug., 1916.	Sept., 1915.
Number ...	746	1,322	637
Value, complete machines ...	£31,700	£64,632	£28,847
Value, tyres and parts ...	£28,130	£35,395	£23,351

#### PETROL FIGURES.

It is interesting to compare the amount of petrol imported during the last three months:

July, 1916.—11,526,600 gallons (duty paid on 10,528,695 gallons).

August, 1916.—28,773,053 gallons (duty paid on 10,017,985 gallons).

September, 1916.—13,532,420 gallons (duty paid on 8,272,239 gallons).

### PETROLIOR.

WE made a further test recently of Petrolior in a 4 h.p. Douglas sidecar, following the report made in our issue of August 17th. This time practically neat fuel was used. It was found that starting was difficult without a petrol injection, but after one injection the engine started to fire but ran badly for a few moments. When thoroughly warmed up no difference could be detected from petrol, except that the engine seemed to be a little more prone to knock, a common trouble with heavy fuels. The price of Petrolior has now been reduced to 2s. 5d. per gallon, in five or ten-gallon drums, and in barrels of forty-two gallons at 2s. 3d. per gallon.

Another view of the  $3\frac{1}{2}$  h.p. horizontal twin Humber. It is interesting to compare this design with the new Indian shown in our last issue. They represent the latest productions in "flat" twins of two countries. The new Humber is fully described elsewhere in this issue.

## WHY DOES THE ENGINE CARBONISE? THE PROBABLE CAUSE AND A SUGGESTED REMEDY.

**P**ERHAPS the greatest fault of the internal combustion engine is the comparative frequency with which the removal of carbon deposits becomes necessary, and the increasingly popular two-stroke type is a particularly bad offender in this matter. It is only reasonable to suppose that the mitigation of this evil, like most others, can best be arrived at through a knowledge of its causes, and for this reason it is worth while considering the most probable.

Air-cooled engines carbonise more rapidly than water-cooled; this appears to prove that the deposit is, to some extent, due to the decomposition by heat of a film of oil on the walls of the combustion chamber. The fact that the rate of deposit is influenced by both the quality and quantity of the lubricant employed gives additional support to the theory that a part of the deposit is derived from this source.

But the greater portion of it cannot be reasonably accounted for in this way. In a properly designed engine it is difficult to understand how an oil film can form to any extent either upon the piston top or the portions of the cylinder which do not come into contact with the piston, and consequently it seems reasonable to conclude that the major part of the deposit is derived from the explosive gas mixture.

### Incomplete Combustion.

It seems to be taken for granted by many that the combustion of the petrol vapour and air mixture is necessarily accompanied by the deposition of soot, a state of affairs which obviously could only be due to incomplete oxidation of the hydro-carbon produced in one of two ways—either by a badly-proportioned explosive mixture (*i.e.*, "too rich"), or by the cooling effect of metal surfaces preventing complete combustion, a reaction somewhat similar to that which takes place when cooled surfaces are brought into contact with a Bunsen flame.

The latter explanation is obviously disproved by experience which demonstrates that the rate of deposit decreases as the efficiency of the cooling is increased, within limits. If, therefore, we assume that the gas mixture be correctly proportioned for complete combustion, we must seek elsewhere for the cause of all deposit not derived from the lubricant, and, in the writer's opinion, the answer is to be found in the condition in which the fuel enters the combustion chamber. All carburetter designers aim at effecting complete vaporisation, and most of them undoubtedly succeed in splitting the fuel into the form of microscopically minute drops of liquid, a primary condition which is ideal for its subsequent conversion into a true vapour, but they usually completely ignore two equally important factors necessary for attaining this result.

### The Cracking of Hydro-carbons.

These are, first, that the vapour pressure of the fuel varies with the temperature, and, second, that energy in the form of heat is absorbed by the fuel when it passes from the liquid to gaseous state.

In other words, as the mixture of air and minute fuel particles changes into a mixture of air and fuel vapour,

the temperature tends to decrease until a point is reached at which further vaporisation practically ceases, and the remainder of the fuel enters the cylinder in finely divided liquid form. When this takes place the cause of carbonisation is obvious. If hydro-carbons in a liquid state are brought into contact with highly-heated surfaces, then in addition to simple evaporation a chemical change (termed "cracking") takes place, carbonaceous matter is deposited, and more volatile compounds are produced.

This method of accounting for the deposit would explain the beneficial effect of water-cooling, for in this case the combustion head is kept at a temperature too low for "cracking" to take place, and simple evaporation of any deposited fuel results.

### Heat the Induction Pipe.

If the above theory of deposit, other than that derived from the lubricant, is correct, then the remedy is obvious. After the fuel has been converted into fine spray and mixed with air in the carburetter, it should be brought into contact with surfaces hot enough to complete the evaporation *before* the mixture enters the combustion chamber. This would probably be most simply effected, not as is sometimes indirectly attempted by a hot air jacket to the carburetter, but by leading an exhaust-heated pipe through the induction tube itself.

The point where the heat energy is required is where the fuel in the form of fine spray has been mixed with the necessary air, and by proper application of this principle it should be possible effectively to vaporise the dense fuels commonly in use at present.

H. WEBSTER MOSS, F.I.C.

Mr. T. S. Bryant writes in praise of his 1916 B.S.A. and sidecar shown above. At the present time he is home on a well-earned leave from Nigeria, West Africa. Being a Government official he has had to overstay his visit to England until the war was over in the Cameroons. Recently, in company with his wife, he accomplished a tour through England of 650 miles and experienced no trouble whatever.

## A GERMAN CRY— MOTOR CYCLES WANTED.

ON Friday last there appeared in the daily papers an extremely interesting memorandum on the experiences of the Fourth German Corps in the Battle of the Somme during the month of July, and a copy of this memorandum has recently fallen into the hands of the British. General Sixt von Arnim writes, of course, without any idea that the document will ever be seen by British eyes. The parts which will especially interest our readers are his references to motor cycles. He points out the weaknesses developed in the German Army. "The reports on the experience gained in the Battle of the Somme submitted to Corps Headquarters unanimously agree as to the necessity for an increased allotment of weapons, means of communication, and transport of all kinds, such as *Flammenwerfer*, anti-aircraft machine guns, captive balloons, reconnaissance and battle planes, double telephone sections, motor lorries, horse-drawn vehicles, motor cycles, . . . etc." Further on he goes on to report, in referring to the question of communication, "The existing telephone system proved totally inadequate," and he makes various recommendations for doubling the telephone section attached to the divisions, for avoiding building lines through villages which we always shell, and asks for a better supply of motor bicycles. "The establishment of motor bicycles proved insufficient for the heavy fighting; the deficiency was painfully evident. The establishment of ordinary bicycles was also not sufficient for the work done."

### British Motor Cyclists "Make Good."

All this is extremely interesting to the British motor cyclist student of the war. It will be seen how the indulgence in this health-giving pastime has been of invaluable service to the nation during the present terrible war. British motor cyclist reserves have not been drawn upon to any great extent. There are thousands and thousands of expert motor cyclists in the British Army doing useful work in riding their machines and keeping open communications. There are still thousands and thousands of motor cyclists in the British Army who are serving in other branches of the forces. If Germany wants motor bicycles it can doubtless get them, though even this is not an easy matter, since Germany's output of motor cycles is as nothing compared with ours. However, an effort could be put forward, and numerous machines could doubtless be delivered in a comparatively short space of time, but the difficulty is to find men to ride them.

We have always made a point of studying motor cycle conditions in all countries of the world, and we have found that England led, and led by many lengths. Germany produced but one make of any note at all, and motor cyclists on the German roads are few and far between. Doubtless the roads had a good deal to do with the development of the pastime. Germany had good roads round the principal touring centres, but the means of communication from one town to another were often in a very bad condition.

## THE F.R.S. ELECTRIC LAMPS.

MANY riders who own first-class acetylene lamps have become somewhat tired of the messiness of carbide, especially so when their

An electric adapter.

journeys are short. Such riders will welcome the F.R.S. electric adapter, a little device which enables electricity to take the place of acetylene. It consists of a small clip carrying a miniature screw bulb, which can be instantly attached to the burner. The wire from the accumulator can pass through one of the ventilation holes.

Another useful article emanating from the F.R.S. factory is the lamp illustrated. This particular one is adapted for electric lighting, and the bulb and

F.R.S. electric motor cycle lamp.

holder can be taken out while the light is on and used for inspection purposes.

The address of F.R.S. Lamps is Per-shore Street, Birmingham.

## DESPATCH RIDERS ON CAMELS.

WE hear that for operating in certain portions of Egypt despatch riders replace their motor cycles with camels. Rather a change in the riding position!

## "THE MOTOR CYCLE" ON ACTIVE SERVICE.

A DESPATCH rider writes from France: "I have been out here now since January, and I have never missed one week in obtaining your most interesting and useful journal. I always manage to get to the nearest town and buy one at an average price of one franc twenty-five centimes (1s.)! I have paid two francs fifty centimes (2s.) for one copy! But then it's worth it out here!"

## THE MAN WITH THE SIDECAR.

WE have received from a correspondent a booklet dealing with the Koehring Mixer. What the Koehring Mixer is or what it does is no concern of our readers or ourselves, but in the pamphlet is to be found a rather cunning eulogy of the sidecar, which we reproduce below, in the real "American" language:

### "THE MAN WITH THE SIDECAR.

"We have seen beautifully finished, costly automobiles with all the 'class,' distinction, snappy lines, and freak tops that fancy paint-mixing and money could produce; but the most beautiful family car we ever saw was a second-hand motor cycle with a home-made sidecar.

"The sidecar wasn't even painted.

It carried the other two-thirds of the family—a wife, who, you could be mighty sure, had given her youth and good looks to the family welfare, and a youngster dolled up like a little princess in a fairy chariot.

"The man on the motor cycle plainly showed that he was not the 'son' of anybody, and that his living came from hard work. His motor cycle outfit was the product of industry, thrift, and his own ingenuity.

"We maintain that he is a better man than many of the nabobs who ride in the stunning big car, for several reasons:

"First of all, he built part of his outfit with his own hands. How many nabobs can even turn down their grease cups?

"Secondly, there's no hypocrisy or four-flush about him.

"Best of all, he takes the whole family along; he finds companionship where he should find it—with his family, not with the 'boys' or at the neighbouring saloon.

"We believe that the sidecar is the sign of a real family man, a symbol of his thoughtfulness and affection. Our hats are off to the man with the home-made sidecar."

## LIVERPOOL MOTOR CYCLIST VOLUNTEERS.

MR. S. W. PHILLPOTT reports excellent progress on the part of the Motor Cycle Section of the Liverpool Heavy Car Battalion of the National Motor Volunteers. The strength of the section is now nearly seventy, and it forms a unit of the battalion.

Drills, lectures, and field days are held at regular intervals, and an interesting diversion was a gymkhana to assist the funds of the Motor Cycle Section. One of the members—a building supplies contractor—has lent the section free of charge a piece of ground on which he will put up a small drill shed and garage for which he will charge a nominal rent. The members, equally enthusiastic, will also assist. Among the members is the Liverpool amateur heavyweight boxing champion, Liverpool City F.C. goalkeeper, and merchants and solicitors, small mechanics and tradesmen.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," Herford Street, Coventry, and must be accompanied by the writer's name and address

#### The Scott Sociable.

Sir,—To me it appears that if the front wheel of the Scott Sociable were placed centrally, the machine would be far more likely to tip over in turning corners. Also it would upset the position of the engine with its extreme accessibility. Of course this is only a suggestion.

Norwich.

R.E.C.

#### Will the Single-cylinder Survive?

Sir,— "Some may come, and some may go,  
But Norton goes on for ever."

Nothing on earth, or Brooklands, in my opinion, will ever oust this magnificent production. Usual disclaimer.

H. W. WILLIAMSON (Lr.), M.G.C.

Sir,—As an old reader of your splendid paper, and an old motor cyclist with an experience of nearly every type of machine made, I would like you to find me a little space to add my "shout" to the many and varied expressions of opinion on the ever-green subject, single *v.* twins.

I was very interested in "H.F.M.'s" letter of September 28th, giving his experiences with a 4½ h.p. big single—the last word in discomfort. He is evidently new to the ranks of motor cyclists, and has not yet heard of the A.J.S., Sunbeam, or Matchless combinations. As a rider of the best makes of both singles and twins, I have come to the firm conclusion that the only place for the single is the track or fast road work (solo), and to use it for the motive power of a sidecar combination is absurd. If, after his 4,000 odd miles of thump, "H.F.M." would get one of the aforementioned machines, he would wonder why makers still manufacture one-lungers. The last few years motor cycle manufacturers have copied "car lines" more and more, as in the instance of starters, three or four-speed gears, interchangeable wheels, mechanical lubrication, etc. (springing is coming, *after the war*). Who makes a single-cylinder car to-day? And who would buy one if one were made? Cost in most cases need not be considered, as the man who can afford to buy a combination can afford the slight extra cost in running attributable to the twin. A. S. BRADLEY.

Sir,—In a recent issue of your paper your contributor "Ixion" says that he tried a modern single-cylinder mount after having confined himself for several years to "twins," and latterly to horizontal twins, and that the effect was electrifying, inasmuch as he would not now think of riding a single. He further invites any reader who has been riding "twins" to try the same experiment.

Now I have ridden "twins" exclusively for some years past, and have always been prejudiced against the single. My last two "twins" were of the horizontal variety. I am now riding a 1916 T.T. single, and the effect has certainly been electrifying, but in the opposite sense to that which is meant by your contributor. I am amazed at the merits of the single. Theoretically, its balance is not to be compared with that of the horizontal twin, but, in practice, with this particular engine the vibration is not noticeable at any speed under 50 m.p.h. At this speed there is a "period," and the vibration is quite noticeable, but above and below this it is negligible. It is far less trouble to decarbonise and keep in tune than the twin, and, engine for engine, it is, in my opinion, far superior to the horizontal twin, its performance with a single gear being equal to that of the horizontal twin with a two or three-speed gear. Take away the gear box from the "flat" twin and put it on level terms with the

single, and you will find it is as dead as mutton. The only feature possessed by the "flat" twin which the single does not possess is the ability to attain excessive engine revolutions, and this it does at the expense of hill-climbing on a reasonably high gear.

Take any decent main road hill, say, good old Westerham, my 500 c.c. single will ascend this hill at 30 m.p.h. on a 4½ to 1 gear with an entire absence of fuss, engine r.p.m. 1,750. The 500 c.c. "flat" twin will not climb the hill at all on a similar gear, and to attain a speed of 30 m.p.h. requires a gear in the region of 9 to 1, with which the engine r.p.m. are 3,500. Now my "single" will also ascend the hill at 30 m.p.h. on a 9 to 1 gear if I require it, and will not make any more fuss about it than the "flat" twin does either; but which performance is the more pleasurable?

Has "Ixion" tried such an ascent on a "flat" twin which has covered 6,000 or 7,000 miles? When the chains and sprockets are worn the gear box shows signs of wear owing to frequent running on the lower ratios and the engine bearings, pistons, and cylinders are not quite as tight as they were once. If he derives any pleasure from the absolutely appalling racket which such a machine makes in the ascent, I venture to think that such will not be the experience of the majority of riders, and it certainly is not mine.

To sum up, no one appreciates an engine's ability to "turn over" under load more than I do; but, if the "flat" twin is going to attain this at the expense of flexibility at low speeds and inability to tackle hills on a reasonably high gear, it will, in my opinion, be a long time before it displaces the properly designed modern single-cylinder.

A. C. HUSKINSON.

Sir,—Does "Road Rider" realise that when war expenditure ceases all the world will feel, and be, poor? Cheap conveyance, not luxury, will be the cry of nineteen buyers out of twenty. Peace will bring many vacant factories. The firm for my money will bar luxuries, and turn out only one type of plain, serviceable, and reliable double-purpose mount, with one about 550 c.c. cylinder and well-balanced engine. Its transmission should be non-rigid, and a long range of ratios available. A strong frame and a 5½ in. clearance are essential. With plain strong sidecar or carrier and accessories it ought to sell for less than £40 by the 100,000; while £100 to £150 combinations will only sell by the score, for the next ten years.

TRANSIT.

#### An Expert One-armed Sidecarist.

Sir,—With reference to the paragraph in *The Motor Cycle* of October 5th and work with the R.F.C., I write to say that I am a cripple to the extent of the loss of my right foot, and I have just recently corresponded with the R.F.C., to which I had an introduction, and they reply saying that "under my circumstances it is not possible for the R.F.C. to accept my services, and that no Army doctor could pass me as fit for any form of Army service." This latter point, to my mind, will always be against us, unfortunately, however keen we may be to help and be active. I should be glad to do anything for anyone requiring practical help and experience, if you could put me into communication with such a one. I am a rider of a 3½ h.p. F.E. Triumph at the present moment, and have had riding experience of other makes, and sidecar driving, and car upkeep, and am capable of all the ordinary running repairs and handling. I should be only too glad of any job in connection with motor cycles or cars.

J.B.S.

Christchurch, Hants.

**A Warning.**

Sir,—I should advise motor cyclists visiting the Blackpool district, when purchasing petrol, to make certain that they get it. Returning home recently I purchased one gallon of petrol (?) from a well-known garage. This was measured out from a — tin, and I was charged 2s. 9d. I speedily found out that the so-called petrol was entirely substitute. I do not object so much to being "had," as to the fact that this was debited against my petrol allowance with all due pomp and ceremony.

As substitutes go, I may say that I have found them very satisfactory.

Manchester.

ZENITH.

**Something Wrong Somewhere!**

Sir,—A few of those fellows who passed through your hands to join this corps thought the following incident might interest you.

A N.O. attached to this company managed to borrow a two-stroke for the night. He was not a motor cyclist; no, he had never seen one of the things until he came here, and he did not join up at Coventry, but was transferred from an infantry regiment. Well, he was heard asking for information as to the controls, etc., and the information was given him by another N.O., also of the transferred variety, who had managed to click for another two-stroke.

Everything went well for a few miles, and just as they were nearing Bury the engine of No. 1 started racing. After much deliberation it was decided the gears were broken and the bicycle was pushed a couple of miles. The proprietor of the garage looked at the pair and smiled, then charged them 16s. for a new belt!

We have just heard the box body driver being given most strict instructions to pick that lost belt up to-day.

"NO.4,"

HEAVY SECTION, MACHINE GUN CORPS.

**Electric Lighting for Motor Cycles.**

Sir,—I notice in *The Motor Cycle* for September 28th an interesting article on this subject, and I thought it might be of interest to some of your readers to see how neatly such an arrangement can be carried out.

I enclose a photograph of my machine, and would call your attention to the following points: The accumulator is a Fuller-Block (type BL1), which, in my opinion, is the most suitable accumulator for motor cycle work, as it never "shorts" internally, and it holds its current indefinitely. The accumulator box is a tin-carrying case, which can be purchased for a nominal sum with the accumulator. A lid has been fitted to this, and the accumulator is held inside it between rubber pads.

The screw which can be seen on the lid of the box holds this down securely on the frame and tightens the accumulator in the box at the same time.

The head lamp is a cheap motor car side lamp carried on a home-made bracket, and I have carefully focussed up the bulb (four volt one ampère) by means of packing washers on the lamp holder.

The tail lamp is an F.R.S., in which I use a flash-lamp bulb, with its light somewhat dimmed by means of a resistance coil.

A New Hudson fitted with a storage battery lighting set.

Both lamps are insulated from violent shocks by rubber pads, and, as a result of this precaution, I have never yet broken a filament.

During the last two seasons this outfit has proved extremely reliable, and I obtain from thirteen to fifteen hours light without recharging.

E. C. FRANK EVANS.

**Hub v. Countershaft Gears.**

Sir,—To settle an argument which bids fair to result in bloodshed amongst the D.R.'s at this Divisional H.Q., we should be much obliged if you would give us your views as to the respective speed capabilities of the hub gear and countershaft Triumphs. What we really wish to know is the highest speed attainable by the two models, i.e., hub gear and countershaft (W.D.) on a sprint, assuming the engines to be in decent running order, geared as turned out for D.R. work at the Front. It may interest the writer of the article on page 241 in your issue of September 21st to know that in this Signal Squadron we still have three 1914 hub gear Triumphs in commission, which have done service since the early days of the war, and do not show any signs of giving out.

So far as regards the lightweight, one complaint is inability to get started in four to six inches of mud, when carrying full kit, including blanket, etc., as has been the writer's experience. It is practically impossible to run alongside the machine when endeavouring to start it up. A clutch fitted to this model would certainly be a boon, in winter at any rate.

One of the greatest drawbacks of all machines out here is insufficient mudguard clearance, but I think this point has already been emphasised by other D.R.'s.

As much as I appreciate the good points of the models supplied to us, I am longing to return to my own mount, namely, a Harley-Davidson, which machine carried me with full camping equipment across the U.S.A., a distance of 3,125 miles, to New York, without the slightest mechanical trouble. A great portion of this distance was over trails which even out here at the Front we would not designate as roads. It took seven weeks to complete the journey, this, of course, including stops for sight-seeing, such as Chicago stock yards, Lake Erie, and Niagara Falls, not forgetting Milwaukee, the home of the Harley-Davidson. The worst roads encountered were in Dakota, Wisconsin, and Michigan. In the latter State we had quite a hostile reception from the German settlers, who appeared to guess our ultimate destination, but we pushed on, and finally landed in Broadway, New York, none the worse for our experiences. After a week's sojourn in New York, we boarded the *Adriatic*, reaching Liverpool in eight days.

I.E.F., France.

R. FRANK (CPL.), R.E.

[We submitted the question contained in this letter to the Triumph Cycle Co., who reply as follows: "There is very little difference between the speeds of the Triumph hub gear and countershaft models. Both machines tuned up without structural alterations will do well over fifty miles per hour."—Ed.]

**Overhead Valves.**

Sir,—With reference to the letter from "Rhodesian" on page 299 of your issue of October 5th and the accompanying sketch, it would seem that the placing of the spring at the foot of the long tappet would tend to keep the overhead inlet valve continually open.

S. C. ARMOND.

[The inlet valve spring will close the valve against the lighter pressure of the spring which has been moved.—Ed.]

**Petrol Substitutes.**

[We continue to receive a number of letters complaining of the business methods of Messrs. C. Binks, Ltd., of which those published are a fair sample. Since the publication of readers' experiences, we have received the following letter from Mr. Binks. Both sides having had a hearing, the correspondence is now closed.—Ed.]

Sir,—Referring to the letters which have appeared in this journal complaining about delays and the delivery of Binks fuel, I will make no comment here as to the inaccuracies contained in many of these letters. No doubt they were intended to do me an injury, so I think it is

only right for me to state here the position and the object of the business in Binks fuel.

This fuel department was started primarily to supply motor cyclists who had already purchased my carburettors with this fuel at cost price, to enable them to continue to use their machines. Eventually I was persuaded to supply users of any other type of carburettor. The orders that I have received have been simply enormous, and I think, speaking generally, the great majority of my customers have been highly satisfied, not only as to the excellence of the fuel, but in my general business methods, and also have thoroughly appreciated what I have done for them. I will admit at once that in a certain very small percentage of cases delay has occurred, and the reason of this delay has been from various sources quite outside any control of mine. The procedure is as follows:

A customer writes ordering fuel. He is then supplied with a printed form to fill up, in which it states that some delay may occur, and if he cannot put up with some possibility of delay his money is to be returned at once. Delays may occur for the following reasons:

- Losses of letters in post.
- Insufficient addresses given.
- Incorrect amount of remittance.
- Absence of remittance, although stated enclosed.
- Temporary closing of railways in certain districts for military reasons.
- Cases of fuel side-tracked on railway system.
- Lost on the railway altogether.
- Shortages of men who have been called up to join the Colours.

Urgent calls by military authorities for fuel.

Want of organisation capable of dealing with an absolutely unexpected and unparalleled volume of business.

Apparently some few of those who have ordered fuel have been in difficulties caused by one of the above reasons.

I also receive hundreds of letters every week with no address whatever. In one case I received four letters without any address whatever, and only discovered who my correspondent was by him instructing his lawyer to apply for the return of his money.

I also receive larger numbers of prepaid telegrams without any address, and I really often wonder, if the people who criticise me were in charge of this business, with its 5,000 technical letters and messages per week, whether they would do any better. Personally I doubt it.

The distillers with whom I am working in connection with the making of this fuel are one of the largest and most important firms in the world, and the business of C. Binks, Ltd., is in a sound financial position. Apparently there are some few of your readers whose motto is "Business as usual." I had quite thought and hoped that this idea had died a natural death long ago, as it was one which, if persisted in, would have placed this country in serious danger.

Our manufacturing business here is conducted with the very greatest difficulty, and I feel that the situation is one that calls for patience and forbearance, and I greatly regret that certain of your readers, whom I had intended to benefit, should have endeavoured to cause me an injury by publishing letters such as they have done, many of which, I regret to say, are absolutely untruthful.

I am pleased to be able to say that the organisation, which has been one of the causes of the delay, has now been perfected, and I have made arrangements for the fuel to be actually delivered from our works instead of from the distillery. This fuel can now be despatched the same day or the next day following the receipt of the order, and if no stoppage occurs on the railway customers can expect to receive the fuel in the course of a week's time, but I strongly advise my customers to come and fetch it away from our new department if at all possible.

I feel I must also take this opportunity of thanking a very considerable number of gentlemen who have written to me expressing their gratitude for

what I have been able to do for them, and expressing in no measured terms their indignation that such letters should have been sent and published in this journal.

CHAS. BINKS.

### A Two-stroke on Heavy Fuel.

Sir,—I have three machines in my hands, all of which are fitted with auxiliary tanks for petrol start. They are: 7.9 h.p. American Excelsior sc., 7.9 h.p. clutch Indian, and the 2½ h.p. Champion (illustrated). The Excelsior is fitted with a half-gallon tank on the sidecar chassis, with force feed to the carburettor, the pressure gauge being mounted on the tank itself. Two other pipes, also force feed, are used for cylinder priming. The compression is lowered by two plugs fitted into a Y piece.

The Champion is fitted with the standard Villiers engine and two-speed Albion countershaft gear. The float chamber of the Senspray is bent round to be as close to the cylinder as possible. The fuel, Binks or Kempol, passes round the cylinder inside the radiating fins.

Mr. H. Brocklebank's engine, showing lagged fuel pipe led round cylinder.

The silencer is a new one, and the extension pipe polished copper—the tone given being that of an aeroplane!

The little tank on the top tube holds pure petrol, which feeds primarily to the jet and floods the carburettor without tickling if so much petrol be needed to start. The mechanical horn has a special clip to the down tube, and is very conveniently placed for really making a row. You cant in the ordinary positions of these horns on a solo mount.

Petrol lubrication having been found hopelessly inefficient, a sight feed drip lubricator has been fitted, feeding into the induction pipe, and this, set to keep the engine constantly smoking, allows one to drive at 25 m.p.h. to 40 m.p.h. for three or four hours without any trouble. The engine is always run practically all out, and has been so run for eighteen months, and the bearings have scarcely any wear at all. The disc wheels are made locally, are enamelled red, and look very smart. This machine takes practically all main road hills on top, and will go anywhere on bottom.

As to two-stroke engines, I do not love them. They always four-stroke at starting, and when running down hill the machine overruns the engine; they are very inelastic, and really painfully slow. Their good points are easy starting, handiness, and lightweight for short journeys and constant stops.

The machine in question looks exceptionally smart, and goes well, running as well on Binks or paraffin as on petrol, without any injury to bearings, over a four months' test constant riding.

HUGH BROCKLEBANK.

Mr. Hugh Brocklebank's 2½ h.p. two-stroke Champion fitted with disc wheels and adapted for running on heavy fuel. (See letter.)

# Motor Cyclist Infantry in German East Africa.

## More Experiences of Motor Cyclists with General Smuts.

AS we have already intimated, infantrymen mounted on motor cycles are being used in the German East African campaign, the men being recruited from South Africa and the section known as the South African Motor Cycle Corps. It must not be confused with the despatch riders operating in the same region, a description of whose experiences appeared in our issue of September 21st. The South Africans are mounted on B.S.A.'s, and in addition to these men there are the motor cycle infantry attached to the armoured cars sent out from England. With this introduction we follow on with descriptions of the experiences of the South African motor cycle infantrymen, the first being extracts from a letter from Capt. J. F. Ashley, chaplain of the corps, which appeared in a recent issue of *The Cape Times*:

"... we set out, in a column miles long, for the frontier. Each man had his B.S.A. loaded wherever he could hang something. The first day took us past Bura and Maktau to Mbupuni, the chief difficulty being sand, which caused many spills, accompanied by congestion of traffic and vigorous sarcasm on the part of those following. The second day we set out early, and it proved to be such a day that no one in the corps could recall one like it. A few miles brought us to Salaita, where we viewed the scene of the battle, and in the distance first had revealed to us Kilimanjaro in all its glory.

"Now began difficulties in real earnest. A few miles and we left good roads behind once for all; mud, ruts, rivers, and bumps ever since. The chief sign of the discomfort experienced soon became evident to those riding half-way or further back along the column. All sorts of belongings were strewn along the road, tins of bully (oh, so valuable days later), knives, forks, boots, socks, cups, kettles—all sorts of things that had dropped off machines loaded like miniature pantechinons. So we bumped and jolted to Taveta on the border, where we left our first real casualty with a broken ankle.

### Crossing Rivers.

"A few miles brought us to a river, across which men each carried a bicycle—an exhausting game when you are tired already. A few miles more and another. Then a third of the same unrideable nature; and here darkness fell. The fourth river was passed, though this could be ridden. The roads consisted simply of narrow tracks, about a foot wide, alternately road and lorry ruts, and the great game was to maintain your equilibrium on this narrow track while unable to see more than a cycle's length ahead, and expecting to hit a stone or tree stump every moment. Every now and then the ruts crossed, and disaster followed. And so the procession struggled on, until at last a welcome light flickered over one long ascent. This mounted, sure enough there was a fire and bicycles parked near it. One rode up, throttled down a few yards away, thanking Providence this ride was over, and was assailed by frantic shouts of

'Keep her going! Don't stop! Turn to the right; only four more miles.' You can picture the black despair that settled on one after that. The fire was there to prevent you riding on over a broken bridge and dropping into a watery grave. Some felt for the moment they wished they hadn't been stopped. Then we lay down and slept, feeling that fifty bugles wouldn't get us out in the morning. No, that ride will not be forgotten.

### A Mountain Road.

"The corps rested here three or four days, but our indefatigable O.C. took the strongest from each platoon, and pushed on some ninety miles to see the state of affairs. He came back with them three days later, and his retinue was eagerly questioned as to the road. These men might well have been descendants of those Israelite spies who came back and disheartened their countrymen. But the corps refused to be discouraged. 'It can't be worse than what we've done, or we simply couldn't move.' And away we went—but the machine no longer loaded so cumbrously.

"The roads improved day by day, but still sorely tried our patience and endurance. At one place we passed a remount camp and halted a while. For two days these remounts astonished us by the way they forged along. Hindered by our lorries as we sometimes were, they passed us frequently (chaffing us, too), but then we drew away from them and went ahead. The last sixty miles to the front were on the style of the mountain railway system of some fair or exhibition, for the road travelled along the top of a mountain range, descending at last by a fine piece of engineering by a spiral staircase route."

### Another Officer's Impressions.

Another description is extracted from a letter received from an officer serving with the S.A. Motor Cycle Corps:

"Up to ten miles from Voi (the junction of the new line being built to German East) the ground rises slightly, and the road is straight and very good. My platoon was the advance guard, so I was able to look back; it was a grand sight to see the 400 B.S.A.'s thundering along with their exhausts open. When the corps is on the move it covers seven miles of road, and the engines make a noise just like the breakers on the sea shore. We made fifty miles the first day, which was very good when one takes into consideration the numerous stops which were made to enable the men to adjust their kits and machines. I might mention, incidentally, that our kits take some fastening on, as we carry everything on the cycle. There is about 140 lb. of kit and equipment, viz., blankets, change of clothing, spare boots, three days' rations, 300 rounds of ammunition, dynamite, cooking utensils, rifle, bayonet, sou'wester suits (oilskins), overcoat, semaphore flags, and a hundred and one other things too numerous to mention. We slept the first night by a river, and started off again just as dawn was breaking. The temperature was 120° in the shade, and encountering many rivers with their cold

water every couple of miles was a god-send.

"We again slept on the banks of one of the numerous rivers and struck camp just as the sun was peeping over the horizon. We struggled along manfully all day over the worst roads it has been my misfortune to see, but darkness overtook us before we reached our destination, i.e., New Mosche, which it was essential for us to reach that night. The roads were bad in daylight (never once getting beyond first gear), but, good heavens, riding the same roads at night with all the men knocked up was simply appalling. However, we pitched up at New Mosche (well in the enemy's country), at about 11 p.m., dead beat.

### A Necessary Overhaul.

"The next day the C.O. told us we could devote to overhauling the machines, and I can assure you it was needed. Seventy-five per cent. of the footboards had gone, and nearly every handle-bar required to be straightened, but with the exception of minor repairs, such as replacing nuts, straightening forks, etc., there was no material damage.

"The next day we started off, minus six men who had sprained their ankles, for Kondoa Irangi, the seat of operations. From New Mosche onwards we had sand so deep and soft that the footboards were dragging in the sand that had been made by those in front, and when a poor unfortunate fellow stuck you can just imagine the language that was thrown at him by those in the rear. It was impossible to turn out and pass the offender. However, everything comes to an end, even a road in German East Africa, and on the third day we pitched up at Kondoa Irangi. It was about 11 a.m. as we rode down the slight incline into Kondoa Irangi, and the Huns gave us our first baptism of fire, putting about twenty shells into us from the long range gun (brought from the *Koenigsburg*), but as we were riding at one hundred yards distance between each cycle nobody was hit. We took up a portion of the defence known as 'Observation Kop,' and sweated here for six long weary weeks, enduring many hardships. When our large guns got down to us we were able to retaliate a bit.

### How the Machines stand up.

"Up to the present, after 2,800 miles, with the cycles very much overloaded and used over the worst roads (?) in the world, there is not one machine that cannot take the road at once. Only one gear box has been taken down, and this was owing to the rider having forgotten to fill it up with oil; consequently it seized. The footboards have nearly all been torn away, and 50% of the carriers have broken, owing to the excessive weight loaded on to them. We have found that Dunlop tyres are the best for this rough work, as they appear to be hard and able to resist the action of the sand, and the thorns break off before they penetrate sufficiently deep to puncture the tube."

## DRIVING INSTRUCTIONS FOR TWO-STROKES.

Concise Hints on the Use and Upkeep of the Levis in particular.

**M**ESSRS. BUTTERFIELDS, LTD., makers of the two-stroke Levis, have issued a small booklet of "Driving Instructions and Useful Hints and Tips," and as these are likely to be of considerable use to all riders of two-strokes (though, of course, to Levis riders in particular), we propose to recapitulate some of the most valuable pieces of advice.

### To Start.

After the usual starting instructions, which refer to the filling of the tanks and the setting of the levers, we read: "It is advisable to start the machine with the low gear engaged. When a speed of twelve to fourteen miles an hour has been obtained let in the high gear sharply, to avoid the engine racing unnecessarily while in the free position. Care should be exercised in starting this model, as, owing to the extraordinary acceleration, the machine may 'get away' with you. The clutch should also be handled judiciously, especially when the gear is new.

### Adjustment of Chains.

"It is very necessary the chains should be run at proper tension, neither too tight nor too slack. The two chains from the engine-shaft sprockets to the countershaft sprockets are very simply adjusted by means of the eccentric in the bottom bracket. To take up any stretch which may develop in these chains, proceed as follows:

"On the end of the bracket eccentric will be found a lock ring and adjusting quadrant. Loosen the lock ring, also the

nut which holds the quadrant in position; the eccentric may then be adjusted by means of the quadrant. This adjustment should be very carefully made to ensure neither of the chains being over-tensioned. It is sometimes a difficult matter to get both gear chains adjusted to the same degree of tension, in which case one of the chains must be left with a slight tendency towards slackness. See that the lock ring is properly tightened up after the adjustment has been made.

"The two-speed gear is the Enfield, and is of the expanding clutch type, and is operated by a hand lever affixed above the tank, in a position convenient to the driver's hand. There are no clutch or gear pedals whatever."

### Lubrication.

There is much useful information on this important point and also a description of the method of lubrication employed on the Levis, which is as follows:

"We lubricate our cylinder and piston walls by leading oil to the side of the cylinder, this oil-feed being passed onwards on every upward and downward stroke by the gudgeon pin, giving a steady feed of oil to both sides of the piston. Any surplus of oil that is swept off the piston on its upward stroke is not allowed to fall into the base chamber, but is collected and led to the pulley side bearing, which, of course, is the longest and most important of the crankshaft side bearings. The crankshaft is drilled and plugged, giving a free passage from the one side, through the webs and throw pin, to the other side; the hollow crankshaft being fed through the magneto driving side main bearing, this feed corresponding with the feed hole to the inside of the crankshaft, and an outlet hole is placed in the throw pin, feeding the big end bearing, the other outlet hole feeding the pulley side bearing.

"Will riders please note that we have given up drilling the central holes in the gudgeon pin, for we have found that the little end bearing gets sufficient lubrication from the accumulation of surplus oil, in view of the fact that this bearing only oscillates and does not revolve, therefore requiring but little oil. Our chief reason for discontinuing to drill these holes is that we have found, when the little end bearing wears, a 'blow-back' is set up through the hole, preventing a steady and regular supply of oil to the piston and cylinder walls.

"Riders are warned to use plenty of oil of a correct quality, and as a safeguard in this respect to keep the engine smoking for the first 500 miles or so. Too much oil in the crank case, however, makes a two-stroke very difficult to start, and causes four-stroking. When this occurs riders are advised to proceed as follows:

"If the oil-regulating screw has been accidentally left on while the machine has been standing, and a quantity of oil has entered the engine, proceed thus: Open the oil-drain tap or plug at the bottom of the crank case and drain off all the oil; oscillating the flywheel will facilitate this. While the oil is running out, remove the sparking plug, and, if oily, clean it with petrol, pouring some into the plug where the points are. When the oil drain tap has stopped dripping, leave the tap open and wheel the machine a few yards, so that the oil from the cylinder can work out; after doing this, close the crank case drain tap, or re-insert the drain plug, as the case may be, when the machine should start in the usual way. The engine may misfire for a little time, and smoke will issue from the exhaust. During all these operations it is, of course, necessary that the lubrication be turned off, and it should not be turned on again until the silencer ceases to smoke.

### Magneto.

"The timing, when controlled by a lever, is as usual, but when the timing is fixed it is necessary to proceed as follows:

**CORRECT** way of removing cylinder. The crank case is in such a position as to cause the piston and connecting rod to be in line with the cylinder while drawing the cylinder off.

**WRONG** way of removing cylinder, which may result in a broken piston.

**Driving Instructions for Two-strokes.—**

"Turn the flywheel forward till piston reaches top of the stroke; now turn flywheel backwards until piston has descended  $\frac{5}{16}$ ths to  $\frac{7}{16}$ ths of an inch, according to the circumstances (for hilly country  $\frac{5}{16}$ ths is recommended, whilst for a comparatively flat district  $\frac{7}{16}$ ths may be used). The points should just be in the act of breaking. See that the gap at the platinum points corresponds to the gauge on the E.I.C. magneto spanner. The E.I.C. magneto requires no lubrication.

**Removing and Replacing Flywheel.**

"To remove the flywheel, after unscrewing the nut, the end of the shaft should be given one or two sharp square blows with a fairly heavy hammer, at the same time holding the wheel firmly with one hand, and pulling away from the engine. At the first or second blow the flywheel should come away, and, if the blows are square and decided, no damage will be done to the threads on the end of the crankshaft, as the end of the shaft is toughened.

"When replacing the flywheel, great care should be taken that both the end of the crankshaft and the hole in the flywheel are perfectly clean and free from grease or grit.

"It is not sufficient merely to pull up this nut as tightly as possible with a spanner by hand, but the special spanner supplied with each tool-kit should be used, and the nut 'jarred' up dead tight by

hammering the end of the spanner as far as it will go—after taking particular care that there is sufficient thread on the end of the crankshaft remaining below the face of the flywheel boss to allow the nut to force the wheel dead tight upon the taper without fouling the last thread.

Removing and replacing flywheel of two-stroke Levis engine.

"A movable spanner is not sufficiently strong for this job, so always use the spanner supplied for the purpose. If a key is fitted in the flywheel, or if a new key is being fitted, see that it takes a bearing on the sides, but not on the top, otherwise the wheel will be prevented from going tightly on the taper, and the flywheel will probably not run truly.

**Removing Gudgeon Pins and Cylinders.**

"Do not remove the gudgeon pin unless absolutely necessary; a light piston may easily be distorted. When it is necessary

to remove the gudgeon pin, make sure that you drive it out the right way, which is towards the flywheel.

"When refitting the piston, be sure you do not put the piston on back front. This mistake has been made more times than one would credit, and results in a surprising loss of power.

"The Levis pistons are made light for efficiency's sake, and while they have an ample margin of strength, it is very important that they be carefully treated when dismantling the cylinder. It is most advisable to stuff the inside of the piston with rag before the cylinder actually comes away, otherwise the heavy deflector head will cause the frail skirt of the piston to come sharply in contact with the connecting rod immediately the cylinder is removed, and will, in all probability, break a small piece out of the piston.

**Fitting New Piston Rings.**

"Replacement rings, as sent out, are necessarily a fraction larger than new ones, and will therefore fit the cylinder after slight wear. Before fitting the rings, squeeze into mouth of cylinder. The gap between the ends should be only three or four thousandths of an inch, and, if necessary, file the ends slightly till the gap is correct. Check that the ends fit nicely round the pegs. If necessary, rub down the top and bottom edges of the ring on a flat sheet of emery cloth till the ring is just free all round. Run in with plenty of oil."

## PATENTS.

Abridged by  
ERIC W. WALFORD.

**An Improved Spring Fork.**

It has often been proposed to form the upper links of spring forks in such a manner that a certain amount of fore and aft movement is permitted. In the construction illustrated this object is attained, and a neat and strong construction is provided by mounting the rear pivots A of the upper links B upon a spindle C, which is free to slide between springs DE in boxes F carried by the upper ball head G. The spindle A passes through slots in the walls of the boxes, so that it is free to slide backwards and forwards within limits, permitting the desired movement of the spring fork. The springs are thus enclosed, and may

be removed by detaching the screwed end caps H.—W. Douglas, No. 14,541, 1915.

**Sidecar Suspension.**

The sidecar wheel spindle A is carried by a fork B, which is pivoted by a long bearing member at C in a loop in the sidecar frame. The wheel carrying fork is acted upon by either a full or half cantilever spring E. The drawings selected show two different ways of carrying out the invention. In the plan view there are two short cantilever springs, one

each side of the wheel, and in the side view is one long cantilever which engages the end of the fork, but in either case the spring can be of the half cantilever type, and arranged above the wheel.—W. Douglas, No. 15,099, 1915.

**A Tool Carrier.**

Instead of this being constructed of tubes with boxes strapped to it, it is built up of sheet metal, so bent as to form a platform at A, which constitutes the top of the carrier, and two boxes B, into which push drawers containing the tools. The sheet metal carrier is supported upon bearings C, the upper ends of which are secured by straps D, which pass round the sheet metal portion and serve to stiffen it. The pockets B enclosing the tool boxes are closed at the back by the flap G, which is hinged to the platform portion A, and can be folded up or down, as the dotted lines show. To the hinged flap is attached the rear extremity H of the mudguard, which consequently can be moved out of the way to facilitate tyre repairs.—G. I. Francis, No. 101,198.

# QUESTIONS & REPLIES

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

## Hub Gears.

**Q.** Will you please tell me if there is any other difference between the Armstrong T.T. three-speed hub and the Armstrong three-speed free engine hub, other than the absence of a clutch? Does the gear occupy the whole of the hub, or only the same space as in the free engine type?—D.R., B.E.F.

The T.T. three-speed hub is much smaller, and does not contain a clutch. It does not occupy the whole of the hub. The main spindle inside is without a slot for the clutch, and a larger sun pinion is fitted.

## Magneto Trouble.

**Q.** I have a J.A.P.-engined  $2\frac{1}{2}$  h.p. motor cycle. When I got the machine the engine would run with the ignition lever slightly retarded. Now it will only run with the lever fully advanced. It is an E.I.C. magneto. Can you tell me what is wrong, and how I can put it right?—D.G.R.

Examine the contact breaker points, turn the engine round, and see if the points separate properly. The distance of separation should be .4 mm. If this is the case the magneto should fire throughout the whole range of advance. If the trouble is as suggested you can easily adjust the break of the points by means of the special spanner and gauge supplied with all magnetos.

## Sidcar Incorrectly Attached.

**Q.** I am riding a Triumph with sidcar, three-point attachment. When going at any speed and I attempt to turn to the right the front wheel immediately skids. I dare not indulge in a burst of speed unless on a perfectly straight road, as this always occurs, even when turning ever so slightly at speed, and I have to shut off at once or skid off the road. The bottom cross stay of the sidcar is cranked to bring the sidcar wheel in line with the back wheel of the motor cycle; and the distance between both wheels, back and front, is equal, and the combination appears to be lined up straight. I should esteem it a great favour if you would tell the probable cause and how to effect a cure.—J.A.

It is rather hard to say what is the matter with your machine without actually seeing it. Evidently the distribution of weight is wrong, and there is too much weight behind and not enough in front. Try and see if you can advance the sidcar slightly.

## A Leaky Pulley Bearing.

**Q.** I am troubled with oil leaking out of the crank case past the pulley flange in my machine, the oil being thrown on to the belt and the left hand side of the machine. I have fitted a new key on to the flywheel, but this has not cured the trouble. Also, I have tried all sorts of packing and washers, felt, and so on, but after a few runs the trouble occurs again.—A.W.

You might possibly cure the trouble by fitting a second air release valve or by having the crankshaft on the pulley side drilled down the centre, and a hole drilled vertically to meet it inside the crank case, so that you get an extra release by this means. This is a practice which is carried out on several makes of machines, and might cure the trouble of which you complain.

## Overheating.

**Q.** I have a 2 h.p. Humber motor cycle, which overheats after a run of about five miles. I am using good oil. B. and B. carburettor, size 26 jet. The gear is 7 to 1, and the petrol consumption 80-90 m.p.g. I drive at about 20 m.p.h. What do you think is the cause of the trouble? The engine will start from cold with the throttle a quarter open and the air lever closed. When the engine has become warm, with the throttle lever a quarter open and the air lever one-third open, I get a speed of 20 m.p.h. If I open the air lever as wide as it will go, I have to open throttle also, then the speed is too fast.—C.B.

We should advise you to use a smaller jet, say a 24, and ride with the spark fully advanced. Also use a good single-point plug, the points of which do not project too far into the cylinder and which are not too thin. You might try a slightly higher gear.

## Lubrication.

**Q.** My machine is a  $2\frac{1}{2}$  h.p. four-stroke. (1.) Which is the best oil for lubricating an Albion gear box? (2.) Which is the best oil for lubricating hubs and forks? (3.) Should the handle-bar exhaust lifter raise the exhaust valve as much as the engine does? (4.) I have a two-speed Albion gear box with no clutch. Would it hurt the engine to run on the stand in the free position? (5.) Can the free position be used going down hill with the engine stopped? (6.) Can the free position be used going down hill with the engine running?—L.J.

(1 and 2.) The engine oil will do for both. (3.) The valve lifter should raise the exhaust valve rather more than does the exhaust cam. (4.) You can run the engine in the free position for about half a minute without doing any harm. (5.) It is better to keep the engine in gear when descending a hill, and raise the exhaust valve. This enables you to cool the engine, also to use the engine to some extent as a brake. If you coast down a long hill with the engine out of gear the difficulty is to engage the gear again unless you have a clutch. (6.) There is no object in doing this with the engine running, as you do not cool the latter in any degree, and it simply wastes petrol.

## Automatic Inlet Valves.

**Q.** I have an old single-cylinder engine (make unknown) of about  $3\frac{1}{2}$  h.p. It has an automatic inlet valve which leaks badly, and allows the engine to blow back into the carburettor so much that I cannot get more than about two consecutive explosions. I have ground in the valve, and also had it ground in at a garage, and I have fitted a stronger spring, but I cannot make it any better. The stronger spring seems to have made it worse. If the engine is turned over compression with the induction pipe off one can feel the air being blown out of the top of the valve. Can you tell me what to do? The valve appears to fit the seating perfectly, and I am sure that the mixture is not too weak, as the engine runs no better when the carburettor is flooded.—L.F.I.

The leak may be not at the valve itself but in the orifice into which the valve fits. See that the surfaces of the joint are clean and true, while a copper and asbestos washer might also overcome the difficulty. The opening should be about five-thirty-seconds of an inch. If it is greater than this it should be reduced by means of a washer.

## IMPORTANT NOTICE.

### GOODS MADE IN GERMANY.

The proprietors of this journal, being fully in accord with the recommendations agreed upon at the Paris Economic Conference, give notice that they will not permit the advertisements of new goods manufactured in enemy countries to appear in this publication, either during or after the war.

ILIFFE & SONS LTD

**Registration.**

**Q.** I recently purchased a motor cycle, paying part of the cash down and the balance monthly. I paid the fee for the transfer of the number, but I shall not get the transfer papers until the machine is fully paid up. Some few weeks ago our police officer interrogated me regarding the registration, and said he had been informed it had been transferred to me, and asked to see the papers. I explained the position to him, which he said was satisfactory. He stopped me again the other day, and now threatens me with a summons if I do not get the papers showing the transfer. Would you inform me if I am clear of the law or not?—G.W.T.

If it is a fact that the machine is properly registered you need not worry in the slightest. All the policeman can do is to summon you for using an unregistered machine, if the registration is not in order. He is clearly exceeding his authority, and he has no right to demand to see your registration papers, though, of course, he may demand to see your local taxation licence to keep and use a motor cycle, and your driving licence.

**Front Cylinder Refuses to Fire.**

**Q.** I have a 1913 twin motor cycle. No. 1 cylinder does not fire until the engine is raced. It has been so for a long time. I have cleaned the plug points, and still it does not fire. Lately, while retiming the Bosch magneto, I noticed that the platinum points of contact breaker in No. 1 open much wider than No. 2. I presume they open too wide. If so, please say what can be done to make them open alike.—H.C.

It is probable that your trouble is due to air leaks in the induction pipe. See

that all doubtful unions and joints are bound with adhesive tape. You should also attend to the following points: Make sure all valves are seating properly, and that the springs are in good order. Try changing the plugs from the sound cylinder to the faulty one. This will show whether the plug is at fault. You should also attend to the contact points; see that they are clean and breaking correctly. The distance should be .4 mm., i.e., about the thickness of a visiting card. You should remove the cam which has the smaller break and pack it up with a thin piece of packing—a piece of strong paper would probably be sufficient. The points separating unevenly might cause the trouble.

**Pre-ignition.**

**Q.** My motor cycle is a 2½ h.p. two-speed A.J.S., 1912, or late 1911 model. It was thoroughly overhauled four months ago, and I have ridden 290 miles since. Up to a few days ago everything seemed mechanically perfect, but now the engine gets excessively hot after a mile or two, and is positively "unrideable" in two or three minutes. Carbon deposit is, of course, naturally suspected, but having regard to the trouble coming with such suddenness, I am loth to go to the trouble of taking down the cylinder. Therefore, I turn to you in the hope that, with your varied experience, you may be able to supply a simple solution of the overheating. I fitted a new sparking plug recently, and the magneto was cleaned only the other day.—R.S.D.

We should certainly recommend you to take down the cylinder and carefully examine every part of the engine, and make sure the piston rings are free in their grooves. Also note if the exhaust valve is lifting properly. The new spark-

ing plug might be the cause of the trouble. Sometimes an unsuitable plug will cause pre-ignition, which may be easily mistaken for overheating, as one gets very much the same symptoms. And do not ride with a retarded spark.

**EXPERIENCES WANTED.**

"R.J.W." (Cork).—4½ h.p. James sc. Hill-climbing, consumption, speed, reliability, and ease of control.

"F.L." (London).—Grado-Multi gear or Philipson pulley on 3½ h.p. single. Belt slip and wear.

"J.M.S." (Leeds).—1913-14 Auto-wheel. Speed, hill-climbing, and use of paraffin.

**READER'S REPLY.****Difficult Starting.**

If "G.H.L." will adopt the following plan he should be able to start his 5-6 h.p. Rudge without difficulty: Turn engine over until inlet valve is open. Inject petrol with oil gun down inlet valve guide; also spray a little petrol over carburettor gauze. Air lever one-third open, and small throttle opening only until engine is started, when air lever can be opened as wide as possible.—H.J.

**RECOMMENDED ROUTES.****NEWCASTLE TO MANCHESTER.—J.W.A.**

Newcastle, Durham, Darlington, Thrusk, Ripon, Ripley, Spacey Houses, Poole, Apperley Bridge, Bradford, Halifax, Sowerby Bridge, Rochdale, Middleton, Manchester.

**CAMBRIDGE TO SOUTHAMPTON.—J.S.B.**

Cambridge, Royston, Baldock, Hitchin, Luton, Dunstable, Tring, Chesham, Amersham, Beaconsfield, Slough, Windsor, Bagshot, Camberley, Hartley Row, Basingstoke, Winchester, Southampton.

**BOURNEMOUTH TO ST. IVES.—H.C.**

Bournemouth, Fleets Corner, Lytchett Minster, Bere Regis, Dorchester, Bridport, Charmouth, Lyme Regis, Colyford, Sidford, Exeter, Moretonbampstead, Two Bridges, Tavistock, Callington, Liskeard, Bodmin, Mitchell, Zelah, Redruth, Hayle, St. Ives. Approximately 193 miles.

**STROUD TO ST. LEONARDS-ON-SEA.—P.R.C.**

Stroud, Nailsworth, Cold Aston, Bath, Warminster, Heytesbury, Wilton, Salisbury, Blandford, Southampton, Fareham, Cosham, Emsworth, Chichester, Arundel, Broadwater, Old Shoreham, Brighton, Lewes, Beddingham, Polegate, Pevensey, Bexhill, St. Leonards. Approximately 182 miles.

**HIGH WYCOMBE TO CHATHAM (AVOIDING LONDON).—F.H.S.**

High Wycombe, Beaconsfield, Windsor, Staines, Hampton Court, Kingston, Sutton, Wallington, at the cross roads turn right and make your way to Purley, then continue through Upper Warlingham, Westerham, Riverhead, Igham, Wrotham Heath, Aylesford, to Chatham. Approximately 90 miles.

Despatch riders attached to the National Motor Volunteers. Two of the machines are Douglasses, whilst the sidecar outfit is a twin Ariel. The photograph has been sent us by F. J. Watson, the owner of the sidecar, and a well-known rider of Swift and Ariel machines.

# MISCELLANEOUS ADVERTISEMENTS.

## PRICES.

**ADVERTISEMENTS** in these columns—First 12 words or less 1/6, and 3d. for every two words after. Each paragraph is charged separately. Name and address must be counted. Series discounts and special terms to regular trade advertisers will be quoted on application.

Postal Orders sent in payment for advertisements should be made payable to **ILIFFE & SONS Ltd., and crossed**

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor St., E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

## NUMBERED ADDRESSES.

For the convenience of advertisers letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charge. Only the number will appear in the advertisement. All replies should be addressed, "No. 000, c/o 'The Motor Cycle,' 20, Tudor Street, E.C."

## DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged, when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

## SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

## DEFENCE OF THE REALM ACT

Under the provisions of the above Act, advertisers requiring workmen, and whose business consists wholly or mainly of engineering or the productions of munitions of war, or substances required for the production thereof, and whose works are situated within 30 miles of London, must include in every such advertisement the words, "No person resident more than 10 miles away, or already engaged on Government work, will be engaged."

Advertisers whose works are situated more than 30 miles from London can only have their announcements inserted with the approval of the Board of Trade, who will allocate to each advertisement a box number, and collect and distribute to the advertiser all application received. The necessary forms of application can be obtained from any Labour Exchange, or from the offices of this paper, and each advertisement must contain a clear reference to the effect that no person already engaged on Government work need apply.

## 'For value received.'

It was Captain Cuffie, that well-known character in Dombey and Son, who remarked: "The hearings of this observation lays in the application on it."

Godfrey's application of the term "for value received" is a thorough appreciation of their responsibility towards each purchaser. A determination to see that he gets full value for his money at the time, and full satisfaction and attentive service afterwards. To regard the sale of each machine as an introduction to further business and to retain the confidence of the motoring public which they value so highly.

Largest stock in Scotland, approximating 200 models of newest best makes at absolutely lowest prices, and slightly used second-hand bargains offered at prices beyond competition for value.

## TO-DAY'S SECOND-HAND BARGAINS ON OFFER AT GLASGOW INCLUDE:

2½ h.p. 1915 twin N.U.T.-J.A.P., 3-speed, T.T. bars, kick start, horn, speedometer, in perfect condition .....	£48 10
3 h.p. 1915 T.T. ENFIELD, 2-speed, horn, lamp, generator .....	£40 0
4 h.p. 1916 CALTHORPE Combination ..	£50 0
8 h.p. 1914 WILLIAMSON and Sidecar, 2-speed, horn, lamp .....	£50 0
7 h.p. 1912 INDIAN and Sidecar, 2-speed ..	£36 0
2½ h.p. 1915 DOUGLAS, War Model, 2-sp., lamp and generator .....	£42 0
2½ h.p. 1915 HOBART, 2-stroke, 2-sp., shop-soiled only .....	£29 10
2½ h.p. 1914 DOUGLAS, T.T., 2-speed ..	£34 0
3½ h.p. T.T. NORTON .....	£23 0
6 h.p. 1915 CLYNO Combination, detachable wheels and spare .....	£68 0

## TO-DAY'S SECOND-HAND BARGAINS ON OFFER AT EDINBURGH INCLUDE:

1916 CRESCENT, 2-stroke, 2-speed .....	£24 0
1916 CALTHORPE, 2-stroke, 2-speed .....	£26 10
1915 CALTHORPE-J.A.P., 2-speed .....	£27 0
1912 RUDGE, 3½ h.p., 2-speed .....	£27 10
1913 7 h.p. INDIAN, Sidecar, hood, screen ..	£40 0
1916 INDIAN, 2-stroke, 3-sp., kick starter, as new .....	£45 0
3½ h.p. LINCOLN-ELK .....	£38 0
1913 3½ h.p. RUDGE Molt .....	£35 0
1915 5 h.p. INDIAN, 3-speed, as new .....	£53 0
1916 ENFIELD 180 Combination, 8 h.p., engine, used few miles only .....	£32 0
7 h.p. INDIAN and Sidecar, spring frame ..	£45 0
1915-16 6 h.p. CLYNO Combination, very completely equipped, new condition ..	£80 0

## MOTOR CYCLES FOR SALE.

## Indian

- 7-9-h.p. Indian, 1915, coachbuilt sidecar, complete, as new; £63.—Tompson, Moors, Morden, Kent. [1954]
- INDIAN**, 1914, 7-h.p., clutch, good condition; £30, quick sale; appointment.—9, Bulstrode Rd., Hounslow. [2922]
- INDIAN**, 1914, clutch model, ready for road; owner officer going abroad; £32/10.—Twiddy, London Rd., Sevenoaks. [X9002]
- 1915 Indian and Sidecar, 7-h.p., excellent condition, only done 1,500 miles; £60.—Apply, 93, Grove Lane, Handsworth. [X9012]
- LATE** 1915 Indian, 3½-h.p., 3-speed, and accessories, as new; £50; seen any time.—Bounds, Garage, 223, High Rd., Kilburn. [2970]
- INDIAN** Powerplus 1916 Combination, run 340 miles only, guaranteed like new, fully and well equipped, cost £115; a bargain, £90. [2970]
- INDIAN**, 1915, 7-9-h.p., T.T., indistinguishable from new; 42 gns. [2970]
- INDIAN** 1914 7-9-h.p. 2 Speeds Combination screen, speedometer, electric equipment, nice order; £45.—6, Warren St., London. [3090]
- INDIAN**, 1915, 7-h.p., T.T. model, disc to back wheel, long exhaust pipe, exceptionally fast, and in perfect order; £45.—Embro Motor Co., Charlotte St., Hull. [2944]
- INDIAN**, 1915, 5-h.p., 3 speeds, kick-start, T.T. bars, with Phoenix coachbuilt racing sidecar, complete with lamp set, horn, speedometer, etc., good condition; £60.—Below. [2944]
- INDIAN**, road racing model, 1915, 7-9-h.p., speedometer, good condition; £45.—Ede and Co., 15-16, Bishopsgate Av., Camomile St., E.C. [0551]
- INDIANS**, model C, in stock for immediate delivery, spring frame, 3 speeds, 2 electric lamps, and horn, also speedometer; £78.—P. J. Evans, John Bright St., Birmingham. [X9049]
- 1915 Indian, 5-h.p., semi-T.T., Montgomery sporting cane sidecar, Stewart mechanical horn, and speedometer, beautiful; £56.—Woodman, Blencathra, Maidstone Rd., Chatham. [3021]
- INDIAN** 1916 Powerplus Model, with coachbuilt sidecar, guaranteed not ridden 80 miles; a bargain at £80.—Exeter Motor Cycle Co. Ltd., Bath Rd., Exeter, and Tavistock Rd., Plymouth. [0839]
- INDIAN** Powerplus, 7-h.p., 3-speed, T.T., rigid frame model, Dunlop tyres, £75; spring frame touring model, £85.—In stock for immediate delivery at P. J. Evans, John Bright St., Birmingham. [X9051]
- INDIAN**, 1914-15, 7-9-h.p., spring frame, and low sporting sidecar, guaranteed as new, some turnout; photo on request; £60, or exchange 2-seater car.—C.H.R.L., 38, Langham Rd., Teddington, S.W. [2958]
- 1915 7-9-h.p. Indian, 3 speeds, and luxurious 2-seater sidecar, electrically equipped, speedometer, new tyres, all spares, splendid turnout, guaranteed perfect order; £75.—1, Richmond St., Bainsley. [X8945]
- BIRMINGHAM** Indian Agent, P. J. Evans, 87-91, John Bright St.—Immediate delivery, ex-stock, 5-h.p. 3-speed standard and sporting models, with and without sidecar, price £70; sidecars from 11 gns. [X9050]
- 1916 Powerplus Indian Combination De Luxe £21 sidecar, mag., dynamo outfit, electric lamps, and horn, speedometer, the lot as new and unscratched, perfect condition; cost £113, for quick sale, £80, no offers.—Particulars, Russell, Clifford St., York. [3149]
- BARGAIN**—Indian, 7-9-h.p., T.T. model, in new condition, lamps, speedometer, etc., £40; 1915 7-9 h.p. combination, in perfect mechanical condition, electrically equipped, speedometer, De Luxe sidecar, with apron, etc.; £72/10.—Oram, 20, Caddington Rd., London. [3078]
- 1914 7-9-h.p. Indian Combination, new April, 1915, 2-speed and clutch, spring frame, speedometer, electric lighting and horn, Montgomery 20 gns. sidecar, all as new, and unscratched; no dealers; £58; appointment.—C. P. O. Wolsey, Naval Air Station, Roshamptown, London. [3134]
- NEVER** Again.—Genuine 1914 7-9-h.p. Indian, spring frame, 2 speeds, clutch, electric lamps and horn, 28x3 covers, speedometer, engine and gears overhauled at cost of £10, complete with £35 Gloria Projectile sidecar, climb all hills on top; £48 secure if unsold.—Millards, Drapers, Chesterfield. [X9037]
- P. J. EVANS**, Birmingham and Midland Indian Agent.—All models in stock for immediate delivery; 5-h.p. 3-speed model, £70; 7-h.p. T.T. Powerplus, £75; 7-h.p. 3-speed, spring frame, and electric light, £78; special De Luxe 7-h.p. Powerplus, with spring frame, £83; sidecars from 11 gns.—87-91, John Bright St., Birmingham. [X9045]
- Ivy.
- IVY-PRECISION**, with sidecar, 1913, 4½-h.p., Sturmer-Archer 3-speed, overhauled; £26.—Stares, 65, Tulseimere Rd., West Norwood. [3099]
- 1915 Ivy, 2½-h.p., quarter-plate Ensign De Luxe, accessories, acid glass; sell £38; exchange 2.3 speed higher power, cash adjustment.—O.P., Aston Tirrold, Wallingford, Berks. [3108]
- Ixon.
- IXION**, 2½-h.p., late 1915, fitted to use substitute, in splendid order; £20, or nearest offer.—3, Kingsley Rd., Daventry. [X8941]

## The Desirability of Larger Tanks.

**W**E have on several occasions pointed out the advantages that would accrue to motor cyclists by the fitting of larger tanks to their machines. This has been done by many makers in the case of machines used for competition purposes, but has not become at all general on touring motor cycles. In these days of petrol restrictions the necessity for ample fuel carrying capacity has become more marked, even when a petrol substitute is used, for most riders will have their own particular fancy in fuel, and these fuels cannot be purchased in every place in small quantities. We have heard of a garage where not less than a gallon of petrol was ever supplied at a time, because the garage possessed only a gallon measure and the regulations order that all petrol must be sold by imperial measure. Some garages indeed refuse to supply less than a tin, the excuse being that it is frequently impossible to give two separate gallons from each tin. On the other hand, we have seen petrol weighed out to a customer (half a gallon being reckoned as 4 lb.—presumably it was No. 3).

Increased tank capacity is one of the requirements for machines intended for Overseas service. Even comparatively near the centres of population, stores where petrol may be obtained are much farther from one another than in England, and consequently Overseas motor cyclists are lucky to have machines fitted with large capacity tanks carrying spare tins. Some of the demands of Overseas riders may appear somewhat unnecessary, but there is no doubt that the appeal for increased tank capacity is quite justified, so that bearing this point in mind also manufacturers can "kill two birds with one stone" by making modifications on the lines indicated.

It is desirable, moreover, that a motor cyclist, especially when on tour, should be able to carry a good supply of fuel, and if his tank will accom-

modate the contents of a two-gallon can, so much the better. Spare cans attached to the carrier are, to say the least, unsightly; they are apt to interfere with the balance of the machine, and unless very firmly fixed they will certainly rattle. Also it is advantageous to be able to take in a gallon while the tank still contains enough spirit to run twenty miles or more, as this minimises the risk of running short where supplies cannot be obtained.

## Warm the Carburetter.

**A** GOOD many readers who have taken an interest in the descriptions and drawings of vaporisers which have appeared from time to time in these columns have latterly tried the effect of such fittings in conjunction with pure petrol, often with extremely satisfactory results. Of course, the vaporisers introduced of late were primarily intended for use with heavy fuels, but the improvement detected even with petrol only confirms an impression we have had, and which we have stated in print on several occasions, viz., that the average carburetter fitted to motor cycles would be improved were it possessed of some permanent form of heating device. Users of early motor cycles fitted with Longuemare carburetters will recall that a pipe conveying warm air to the heating compartment around the spray chamber was regularly fitted ten or twelve years ago. A user of a 6 h.p. sidecar outfit, who is himself an engineer, quite recently fitted up a warming jacket around the induction pipe of his machine, a pipe being led from the exhaust to heat up the chamber. The result obtained quite surprised him, for, instead of his former sixty-five miles to the gallon, he is now regularly obtaining seventy-five miles, so we are told. The scarcity of petrol was the cause of the heating device being fitted, but the owner is now delighted that he effected the change. Other readers' experiences would be interesting.

## A TALE OF JOY AND WOE.

An Officer's Story of a "Glorious Blind,"  
with a Sequel.

By GEOFFREY S. DAVISON, Lt. R.E.

**T**HIS is a tale of disappointment—of misplaced confidence and shattered hopes. I have had my experiences on the roads of Flanders. I have had my sideslips and my falls, my pirouettes and my hairbreadth escapes. These were on roads that were not roads, but sandy tracks, and where mud clogged the wheels or dust choked up the carburetter.

There were no hills there, but the top gear of  $5\frac{1}{2}$  to 1 was none too low for my 4 h.p. "bus." Often, to negotiate a bad bend, it would be necessary to change down to second, sometimes to low. There was no excessive vibration on the big single—no sign of overheating.

At times I would enter into argument with some new-comer to the land of war. He would decry low gears. In England, he would remind me, he geared his  $3\frac{1}{2}$  h.p. sidecar machine at  $4\frac{3}{4}$  to 1. Here was I riding a 4 h.p. solo at a considerably lower gear. It was disgraceful—cruelty to petrol engines!

I would advise him to leave well alone. Six months I had had, riding almost every day, and I had never as yet found the gear too low. I could bear my hand on the cylinder immediately after a run—vibration was not noticeable.

Then came the day when the powers that be pulled us ruthlessly from the line, and placed us in a spot—by courtesy a village—in which billets and beds did not abound. (This was a pity, for we had expected to live in clover for a time!) Here was a difference in the countryside. It was no longer flat. No longer did we see a ditch on each side of every "road." There were *hills*, and, more than that, broad wide roads.

I was astride my trusty horse when first we came to these roads, and I swore the time would not be long before I was on them with a motor bicycle. One road in particular was better than the rest. It was wider than any I have seen in England; it was smooth and straight.

That is the first part of the tale. The second is of my disillusionment.

### The "Old 'Bus'" "Blinds" Again.

What is more delightful than a glorious "blind," with no concealed turnings or hidden men in blue? Motor cyclists who have lost their machines for the period of the war or have been unable to use them will appreciate my feelings as I turned into the main road and gave the old "bus" a final pump of oil before letting it go "all out." I had six miles to go, and I made bets with myself that I would cover it in ten minutes. That would be from thirty-five to forty miles an hour. Ye sparking plugs—what easier?

I opened the throttle and leant forward on the bars. We were away, "blinding" along with the noise

(if not the speed) of an aeroplane. Oh, the delirium of it! What a bicycle, what an engine! Six months of cart tracks and fields, and then—this! For the time the war was but a pleasant game.

It lasted just two minutes, in which I covered close on a mile and a half. Then, with a few "splutters," a few sickly "pops" in the silencer, the old "bus" knocked off work and came slowly to a standstill at the side of the road.

### Burnt Valve!

I got out my toolkit, and realised that the war was indeed a terrible affair. The valve cap, as I might have expected, was "solid" in the cylinder. Hammering, kicking, swearing were of no avail. It was immovable.

Just when I was giving up hope, and deciding that in future my pastimes would be push-bicycling or marbles, salvation presented itself, in the form of an R.E. subaltern, whose horse I had scared off the road a mile back. Luckily he failed to recognise me as the cause of his sudden plunge across country, and listened to my tale of woe with sympathy and concern. He was a motor cyclist in civil life it appeared (What R.E. subaltern is not?), and there was a dear old Rudge awaiting his return to England. So he dismounted and hit the spanner with the butt-end of a King Dick till he missed the spanner and hit his thumb. . . .

### Ignominious Progress.

Then we tied the motor bicycle to the back of his horse, and he towed me to a village blacksmith. After an hour's heavy hammering the blacksmith, gabbling French the while, managed to shift the refractory cap. I fitted a new exhaust valve, replaced what was left of the cap, and in a few minutes went on my way rejoicing.

I went slowly for a mile or so, afraid that the new valve might burn in the same way as the old. But the engine had such a healthy beat, and the call for speed was so irresistible, that once more I opened out and fastened my nose to the lamp. Off again, faster than before. Odds pistons and gudgeon pins—'twas grand! Phew! That dog nearly had me! Never mind—he was only a pup, and would probably have squashed out flat! What's the use of worrying? D—, here's a cow! Didn't miss her by much, either!

But every joyous experience must come to an end—and war is war.

At home my old single-gear  $3\frac{1}{2}$  is waiting on its stand. Its usual gear is 4 to 1. On this it scales all ordinary English hills, and, if the pulley be let down, it climbs Porlock or Rising Sun with ease. I prefer it too, for the army 'bus, excellent as it is for bad roads and ploughed fields, must necessarily carry its heavy tyres, gear box, reinforced frames, and huge tanks!

### Discarding the Two-stroke.

It would be interesting to have heard the discussion between the technical heads of the Hendee Company at which the jettisoning of their 1916 baby two-stroke was decided upon. This is the first instance—to the best of my belief—of any leading firm adhering to cheap lightweights, but scrapping the two-stroke principle. Needless to say, in this case the two-stroke was not judged on its merits. In the absence of competitions and the existence of prohibition, the British market, on which two-strokes were already popular, was practically barred to the 1916 baby Indian. Of the American market we know little, except that lightweights are scorned there, and that the riding conditions are exceptionally severe—so much so, indeed, that nothing under 7-9 h.p. has really made good in the States. Nevertheless, the Hendee people have not abandoned the manufacture of lightweights, and their new flat twin is distinctly reminiscent of the 249 c.c. A.B.C. engine, which has yet to make a public *début* on a motor cycle, and was originally produced in response to the demand for a feather-weight engine starter for seaplanes. The real interest of the Hendee programme lies in the following question—has the two-stroke been scrapped out of deference to American prejudices or because the Hendee Co. have satisfied themselves that the miniature flat twin has the two-stroke beat for ordinary purposes? We may have to wait a long while for this piece of information.

### More Flat Twins.

Whatever may be the facts of the above enquiry, it is abundantly clear that the horizontal twin is rapidly gaining ground. One of the largest British firms (the Humber Co.) takes its stand with the Indian firm among the latest converts. The *pros* are its perfect balance and colossal revolutions, as contrasted with single-cylinders; and the greater durability of its bearings, as compared with the V twin. The *cons* are the difficulty of making all the engine details accessible, and the problem of designing a satisfactory frame to accommodate this type of engine in sizes over 350 c.c. In other words, its conquest over the single and over the V twin in sizes up to 350 c.c. is already inevitable. The extension of its field must depend on the success achieved by designers in dodging the pitfalls of inaccessibility and faulty frame construction. I am not sure that I ought not to add easy starting to the list of *pros*, but I hesitate to do so, as a certain percentage of singles and V twins are splendid starters nowadays. So I will only say that I never owned a flat twin which was not absurdly easy to start. For example, I am a very lazy man, and my A.B.C. 3½ h.p. is on the heavy side. I broke its kick starter in the first week of ownership, and I have never made any adjustments to the engine, carburetter, or ignition.

But I have not troubled to refit the kick starter, because the machine invariably starts in a yard from stone cold, even on the noxious fluids which now masquerade as No. 3 petrol.

### Workmanship.

Mr. D. H. Smith probes the core of the British motor cycle industry when he names workmanship as its distinguishing feature. Our best workmanship is still head and shoulders above that of any foreign motor cycle I have ever seen; and our ordinary workmanship, as exemplified in our second and third-rate machines, is superior to the average in rival countries. This dictum may not be endorsed by the dilettante type of week-end rider, who never forces his machine, and who rides chiefly at week-ends, but I have no doubts of its truth. I secretly fancy that two friends and myself constitute a trio of the hardest riders in the kingdom; we are out every day in all weathers; we ride long distances; we like speed; and we are so busy that we never tinker until we have to do so. Whenever we foregather, we find ourselves unanimous on this point of workmanship. On the other hand, workmanship is not everything. I ventured to slang a farmer for using American binders the other day, pointing out the shoddy character of the details by contrast with a far more substantial British machine. He agreed with my point *in toto*; but he mentioned four defects of our agricultural machines which had influenced him in buying American stuff. The British machines were too costly; they were too heavy; they wore too well, being out of date long before they were worn out; and they lacked many ingenious little conveniences offered by American makers at a far lower price.

### Mutatis Mutandis.

The comparison does not apply very precisely to motor cycles. American machines are not cheaper, partly because America has never produced a decent single-cylinder machine, and freights and tariffs prevent their big twins from selling at highly competitive prices (this will come; America's best 7 h.p. sells at £55 in the States, whereas our best singles cost more than that). American machines are not appreciably lighter, because they prefer to include such weighty items as lighting outfits, 3in. tyres, and rear springing, which few British makers have adopted as yet. Neither British nor American machines are within measurable distance of becoming absurdly durable. Nevertheless, considering the comparatively undeveloped state of the motor cycle industry, the comparison bids fair to be realised. Superb workmanship may in time become the main keynote of British motor cycles if we do not wake up. It is a splendid feature; but it cannot stand in isolation against a combination of satisfactory workmanship, low prices, and lavish specification, especially as many riders fancy new machines each year.

# TWO LUXURIOUS MOTOR CYCLES

## A COMPARATIVE ROAD TEST OF TWO MULTI-CYLINDER MACHINES.

**W**E have recently been able to sample one of the few 1916 model 8-10 h.p. Hendersons at present in this country. It is just a year since we last described the running of the 1915 model of this machine, and very well pleased we were with it. Although the present engine has a cubical capacity of 978, and the cubical capacity of last year's model was 1,065, we cannot say that we noticed any difference in power.

It may be gathered from a reference to our description of the machine, which appeared on page 470 of the issue of May 18th, 1916, that the chief improvements of the 1916 model over the 1915 were in points of convenience. We were especially struck by the very convenient clutch control now fitted, which could be operated either by hand or foot. Personally we should prefer the hand control of the clutch to be effected from the handle-bar, whereas actually it is carried out by the usual American practice by means of a side lever. We also much appreciated the fact that the control, as regards the pedals, followed usual car practice, the clutch pedal being on the left and the brake pedal on the right. Both clutch and brake work with commendable smoothness, the clutch, though of very small dimensions, taking up the drive with an altogether silky sweetness, yet never slipping in the slightest degree. The brake, though amply powerful, was in no degree fierce.

### Flexibility and Acceleration.

The great charm of the four-cylinder Henderson is its extreme flexibility, which permits one to crawl on

Two distinctive machines on the road—a four-cylinder Henderson and 3½ h.p. A.B.C.

top speed without slipping the clutch almost at walking pace. From the latter speed the engine will accelerate to almost any degree, and a wonderful acceleration it is. Up to about twenty-five miles an hour the engine is quite imperceptible, though at speeds over that there is a slight tremor, which, though noticeable, is not unpleasant. A share of the credit for the ample power, flexibility, and acceleration is due to the excellent Schebler automatic carburetter with which the 1916 Henderson is fitted.

All one can find fault with in the Henderson is its weight, a point not noticed when the machine is started, but one which renders it somewhat awkward to handle while wheeling it about. Another point open to improvement is the kick starter, which does not appear very strong and does not give sufficient surface for the foot. On the occasion when we took over the machine the engine started on the third kick, but it did not behave quite so well in our hands, and eventually the pin of the kick starter broke. The engine thereafter was started by pushing the machine along with the low gear in and the clutch out, then engaging the clutch with the hand lever and quickly declutching it again. In about thirty seconds the engine was hot enough to run with the air fully open, and would continue to run likewise throughout the day.

In the open country the Henderson's acceleration was exhilaratingly glorious, and, although no opportunity came of letting the machine out on the road, we had a very good inkling of the speed it would attain. On hills it was a real joy to drive, and would take quite respectable gradients at a fast speed, slow down at corners, and then quickly pick up again as if the road were level. The excellent saddle, which properly fitted the body, hinged at its forward end and its rear end suspended on coil springs, was

On the 1917 model Henderson (just introduced in the States) the chief feature is the adoption of a three-speed countershaft gear.

**Two Luxurious Motor Cycles.—**

delightfully comfortable, and further comfort was due to the 28in. x 3in. tyres.

**A Comparison between Two Entirely Different Machines.**

This machine was in our possession for some time, and before parting with it we were invited to try another very ambitious mount, namely, the  $3\frac{1}{2}$  h.p. A.B.C., the rider of which was equally keen to try the Henderson. Accordingly we set out together, he on the four-cylinder monster and we on the lighter A.B.C. The comfort of the bigger machine was due in some degree to not pumping the back tyre very hard. The difference between it and the A.B.C., which, as all the world knows, has a spring frame, was practically negligible. The reason for this, we take it, was due to the fact that the A.B.C. had an extremely uncomfortable saddle, which in no way conformed to the shape of that part of the anatomy which rested upon it. The A.B.C. had standard 26in. x 2 $\frac{1}{2}$ in. tyres, but the spring frame rendered the comfort of the two just about equal; still, we venture to think that had the A.B.C. had a slightly better saddle it might have scored from the point of view of comfort. It is an extraordinarily handy machine, running with comparative quietness, and possessing a degree of acceleration almost equal to that of the Henderson, if not quite, although one had perhaps to change gear occasionally to obtain it, and an absolutely vibrationless engine. We drove the smaller machine practically all day, and no matter which of the four gears provided was in engagement no vibration could be felt from the engine at all, while the four-cylinder machine which possessed a two-speed hub produced a slight, though not altogether unpleasant, "period," which was apparent at certain speeds.

**Evenly Matched.**

Of the two, perhaps the Henderson may be called the more complicated on account of the multiplicity

of cylinders. The 1916 model possesses only two speeds, and these were ample on account of the power of the engine, as the low was only used for starting and once on taking the bad corner on Ranmore Common, while the A.B.C. has four, and yet so easily was the gear changed that the complexity of the four-speed box in no way detracted from, but on the contrary greatly added to, the pleasure of riding. It should be added that the 1917 Henderson has a three-speed countershaft gear box.

We have referred previously to the extraordinary acceleration of the Henderson, but on the few occasions on which we tried it when running with our companion we found that the A.B.C. was not left half a length behind. As regards flexibility, the A.B.C. was almost equal to the four-cylinder, and there is no doubt that it is a wonderfully efficient machine, as our contributor "Road Rider" has stated.

**An Interesting Day.**

A curious fact was noticed on letting down the A.B.C. from the stand. Instead of the back wheel dropping with a thump, as happens with an unsprung machine, it came down with a curious cushioning effect only experienced on motor bicycles when the back tyre is half flat.

From the point of view of brakes there is very little to choose between the machines. The A.B.C. was fitted with two side-by-side internal expanding brakes which have recently been described in *The Motor Cycle*.

Altogether the day was a most interesting one, as it is very rare for us to have the opportunity of testing two machines which probably show more originality in design and a greater divergence in construction than any other pair which could be selected in this or any other country. These models represent the British and

American designers' ideas of a luxurious two-wheeled motor cycle, so ambitious that they are devoid of no refinement obtainable in a car. Moreover, they are thoroughly sporting mounts, having such a turn of speed as would enable them to leave any but the best cars far in the rear.

Power unit of the 1917 Henderson. The three-speed gear lies transversely to the plane of the machine. The crankshaft is prolonged to take the clutch and a bevel pinion, the latter engaging with the crown wheel on the mainshaft of the speed gear. The kick-starter is seen on the left.

The four-speed horizontal twin spring frame A.B.C. On the latest models the kick-starter is enclosed.

## BEARING PRESSURES.

### A Comparison between the Long and Medium Stroke Engine.

SOME little while ago "Ixion" issued an invitation for a reply to Mr. Norton's claims with reference to the superiority of the long to the medium stroke engine. Now I happen to have been using two machines, one representative of each type, and I have taken the trouble to compare the two engines closely, and have put the results of the comparison into non-technical language, which will, I think, be more readily understood by the majority of readers.

It is first necessary to tabulate a few details of both engines:

82 x 120 mm. Engine (633 c.c.)	88 x 96 mm. Engine (584 c.c.)
Revs. per min. .. 1,500	Revs. per min. .. 1,500
Big end speed .. 1,854 ft. per min.	Big end speed .. 1,585 ft. per min.
Piston speed .. 1,181 ft. per min.	Piston speed .. 945 ft. per min.
Diam. of gudgeon pin .. 5/16 in.	Diam. of gudgeon pin .. 5/16 in.
Diam. of crank pin .. 7/16 in.	Diam. of crank pin .. 1 1/4 in.
<b>Weight of Parts.</b>	
Weight of piston .. 17 ozs.	Weight of piston .. 19 ozs.
Weight of connecting rod .. 17 ozs.	Weight of connecting rod .. 18 ozs.
(divided as)	(divided as)
On big end (rotating) .. 10 ozs.	On big end .. 11 ozs.
On small end (reciprocating) .. 7 ozs.	On small end .. 7 ozs.
Total reciprocating parts .. 17+7=24 ozs.	Total reciprocating parts .. 19+7=26 ozs.

Employing flywheels of the same diameter, we can, on the short stroke engine, make our crank pin of a greater diameter than that on the long stroke engine.

The diagram representing the flywheels of any engine, bringing out mainly the rim portion, proves this. The distance marked C is the clearance which is essential under the flywheel rim to admit the connecting rod big end.

In two engines, one of 120 mm. stroke and the other of 96 mm. stroke, the difference in this clearance is 12 mm., enabling the crank pin to be at least 6 mm. larger in radius, i.e., 12 mm. larger in diameter for the medium stroke engine.

Having a larger bore, the short stroke engine will, of course, have more space between the gudgeon pin

Showing how a larger crank pin can be used in a medium stroke engine, flywheel diameter being the same in each case. The necessary clearance for the big end is shown at C.

bosses in the piston than will the long stroke engine, and will thus admit of a wider small end to the connecting rod and a wider bush. There is practically no reason for supposing the gudgeon pin can be larger in diameter in either case. These points appear to have been grasped by the designer of the medium stroke engine under consideration, as his gudgeon pin is the same diameter as that of the long

stroke, but is wider, whilst his crank pin has a greater diameter. Of course, another point arises in the width of the big end bearing. By placing a comparatively small diameter cylinder on a wide crank case, the long stroke engine designer can make his big end as wide as the big end of the short stroke is naturally, but, of course, a slight sacrifice of appearance is entailed.

### Explosion Pressures.

With regard to the greater pressure due to the explosion on the bearings of a medium stroke engine, owing to the greater

arc of the piston head, we must remember that wear is dependent not only on the pressure, but also upon the distance through which the pressure is exerted. Now, granted we do not obtain a higher explosion pressure on a long stroke engine, and the area of the medium stroke engine piston is greater, therefore, to equalise the work done, the pressure on the bearings of a long stroke

The greater angularity of the connecting rod in the long stroke engine.

engine must occur through a greater distance, and thus tend to equalise wear. This accounts for the peculiarity of a long stroke engine known as "hanging on" under load at low speeds especially, but it is not a help to long life for the bearings by any means.

Briefly, we may thus sum up for the effect of explosion pressures on the bearings of the connecting rod.

1. The bearings can be larger for a medium stroke big bore engine than for a long stroke small bore engine, other conditions as specified being equal.

2. Although the pressure is momentarily greater for a medium stroke engine, its greater bearing area helps to equalise matters, but the long stroke engine suffers wear for a greater distance of its bearing travel.

3. On the main shaft bearings the wear will be equal, as far as explosion pressures are concerned, on both engines, as the total power transmitted will be equal. These bearings, of course, will be of the same diameter and length in either case.

I will now consider wear on cylinder walls and piston, as these have the same relation to each other as a bearing and pin.

Regarding the cylinder walls, as, of course, a greater length of cylinder will be exposed on the long stroke than on the short stroke engine, we may fairly assume that the question of lubricating the walls of the long stroke engine will be more difficult to solve than in the medium stroke engine, and where, as is usual on motor cycle engines, the lubrication is by

**Bearing Pressures.—**

"splash" from the flywheels and connecting rod, the cylinder will, it is reasonable to assume, be starved of lubricant at the higher end. This state of things will cause heat and wear in the cylinder and piston, and a greater tendency to distortion than will occur in a medium stroke engine.

**Angularity of Connecting Rod.**

Another source of wear is derived from the angle which the connecting rod makes with the cylinder wall.

In the engines I am discussing the length of the connecting rod is in either case 8 in. between centres. Therefore, as can be seen in the sketch on the previous page, the centre line of the connecting rod must be more nearly parallel to the cylinder wall on the medium stroke engine, and must thus exert less thrust on the wall than is possible with the other condition of engine.

The stroke of the long stroke engine is 120 mm., that of the medium stroke engine 96 mm., i.e., the former engine has a stroke exactly  $1\frac{1}{4}$  times the latter. This, then, will be the ratio of the pressure acting on the cylinder walls in favour of the medium stroke engine. Again, the angle through which the connecting rod swings is, of course, dependent on the length of stroke, this in its turn governing the wear on the small end bush. The further the bush moves on the pin in a given time the greater will the wear be. I think we may say, then—

1. Pressure of the piston on the cylinder wall must be greater on the long stroke engine, and therefore cause more wear.
2. Allowing equal gudgeon pin bearing pressures, owing to the increased movement of the bearing on the long stroke, greater wear takes place.

**Centrifugal Pressures.**

Having now dealt with the question of wear generated by the explosion pressure entirely, I will turn to the question of the very important inertia pressures, which, in a high speed engine, play the greater part in wearing the engine bearings.

The factors which influence this wear are:

1. Weight of reciprocating parts.
2. Speed of reciprocating parts.
3. Amount of rotational balance obtained.

In the two engines we have under consideration, we have given already the speed of the piston and rotating parts, taking the balance weights as being effective on a circle equal to the stroke in both cases. This would be the usual method of balancing.

With regard to weights, the advantage is, in these two engines, slightly on the side of the long stroke, and these have been given previously. Knowing we cannot balance a reciprocating body by means of a rotating one, as we must try to do in a single-cylinder engine, we must concede a certain amount of unbalanced weight acting on the crank pin radius.

Now, supposing one takes a mass, say, of 1 lb., and swings this round on a string, it is at once evident that a considerable pull is felt by the hand. Exactly the same condition is set up for the bearings of an engine which is slightly out of balance, causing undue wear. Assuming the engine in both cases to be 4 oz. out of balance, we require to know the magnitude of the unbalanced force at, say, 1,500 r.p.m. This is

found by the formula  $P = \frac{wv^2}{gr}$ , where

$P$  = The pressure or force required.

$w$  = Weight of unbalanced mass in lb.

$v^2$  = Velocity of mass in ft. per sec. squared.

$g$  = Acceleration due to gravity = 32.2 ft. per sec. per sec.

$r$  = Radius at which mass swings in ft.

Thus  $P = \frac{.25 \times 30.9 \times 30.9}{32.2 \times .1968} = 38$  lb. approx.

for the long stroke engine, and

$P = \frac{.25 \times 26.4 \times 26.4}{32.2 \times .157} = 27$  lb. approx. for the medium stroke engine.

It must be clearly understood that these forces are an addition to the existing loads on the bearings. Of course, the stresses due to the reversal of the reciprocating weights at the end of each stroke would show favourably for the medium stroke engine approximately as the above.

When the question of higher speeds is entered, the favourable conditions rest more pronouncedly with the medium stroke engine, owing to the lesser speed of the moving parts. It is important to note the  $v^2$  factor in the given formula, as this, combined with the lesser radius, will always render the short stroke engine the smoother running of the two when other conditions are equal.

From this we are correct in assuming that the medium stroke engine will be lighter on its bearings, and will thus be more suitable for high speed work. There will be much less vibration, and the engine will be more pleasant to handle.

We may say, then, for inertia pressures:

1. The bearing pressures are greater in the long stroke engine, and increase rapidly with speed.
2. There is less vibration and smoother running on a medium stroke engine.
3. Wear on all bearings, especially big end and main shaft bearings, is greater on a long stroke engine.

In conclusion, I may add that, although the long stroke is fairly successful on an engine of four or more cylinders, owing to better rotational balance, on a single-cylinder engine a bore-stroke ratio of more than 1 to  $1\frac{1}{4}$  to 1 is undesirable, and creates unnecessary difficulties in designing a smooth running engine which will wear well.

A.A.S., WH. EX., ETC.

Sections of two engines, 82 x 120 mm. and 88 x 96 mm., approximately to scale. Note that the longer stroke has a narrower small end bush and a small diameter crank pin, whilst the crank case, big end widths, and the flywheel diameters are the same in either case.

### SOME USEFUL WINTER CLOTHING HINTS BY A CANADIAN.

BEING a Canadian and used, as readers can imagine, to great cold, I will outline in this article a few hints and tips as to how to keep warm on the coldest winter day. Although there is a great difference in the cold of Canada and the cold of these Islands, I think the clothing and methods I suggest will meet all requirements.

Firstly, I think I had better explain this difference of cold. In Canada it is a dry cold, so dry, in fact, that the snow is powdery and light. Hence we get a blizzard when strong winds blow, and to make a snowball out in Canada is an impossibility.

Now in this country it is a wet cold, and I think we will leave it at that, except to point out that it is more difficult to deal with a damp cold.

The usual method in England employed to keep out the cold generally amounts to smothering oneself in multitudinous

I have met many and many a motor cyclist with a strap round his midriff in the middle of the summer. Believe me, he only makes himself warmer by doing that, because he generally creates a warm air jacket around himself by the bunching of his clothes. But I digress.

Canadian socks  
worn under  
trousers.

#### How to Keep Warm.

First get, beg, borrow, buy, or steal a real witney blanket, and make what we call a parka. Now blanket is about the finest material we can get for keeping out the cold, and, strangely enough, it ventilates in the most extraordinary way. For instance, many a time have I seen my "pard" "packing" a trail for the dogs. (That is worse than pushing a 7-9 h.p. combination in compression on low gear, I can assure you, and getting whiter and whiter every minute through his perspiration oozing through and freezing solid on the outside.)

Make your parka on the very loose side, so that when you buckle it across the middle you have an air space all round your vitals as in sketch No. 1. As blankets soil, or rather show the dirt

easily through their light colour, it is advisable to have it dyed some shade of brown or grey according to your taste. You can pipe the seams off with leather if you like, so that you can ride without any other over-covering; but, of course, there being more rain than not, you must wear an overall over the

parka. Oilskins I would never advise, because of all the unhealthy garments they are the worst, especially when they are strapped in about your middle.

Now although you have your parka on, I suppose it is needless to tell you that you must still wear your flannel shirt and vest and pants. My own plan is to wear a silk vest next to the skin and a wool one over that. The same with your nether garments.

#### Leg Coverings.

It may astonish you, but the most vulnerable parts of your anatomy for feeling cold, or rather for conveying cold to your system, are the shins. If you will just bend down while you are reading this and feel the poor amount of flesh between your bones there and the cold, cold world you will get at my meaning, and any doctor will tell you the same. So you must protect the skinny parts.

Personally, I wear field boots, one pair of silk socks, one pair of heavy wool over

A coat made of witney blanket.

clothing, leather waistcoats, or leather coats, overalls, oilskins, etc., until one looks like a petrified mummy. Have you ever seen an ordinary no account grey pirate of a two-legged sparrow try to keep warm? If you have I guess you have not known why he keeps so snug during the snow months. Well, I will tell you. He puffs his feathers out at very nearly right angles to his body, with the result that he creates a warm air jacket around himself, and that is the whole secret of keeping warm.

Wool socks over thin  
silk socks.

them, and a pair of Canadian socks. Now Canadian socks are great cold defiers, but if you cannot get them you must try the next best thing which will act in the same way. Take some old sweater and cut off both arms, slip your leg into the arm, and pull to its full length so that the sweater arm covers from just below the knee to the heel. Now take the heel part and turn it back until it reaches about the middle of the calf.

**Cold Weather Clothing.—**

The doubled over part fills every cranny of the loose part of the boot (looseness again, you see, tells), thus forming a very warm nest for the ankle and effectually warming the foot down to the toes, the upper part of the sweater warming the shin bone and lower leg.

For the thighs, a good thick pair of Bedford cord breeches will do with your wool pants; but, to feel really warm, over the pants should be worn very loose wool breeches cut on the same principle

as the Bedfords as in the illustration. You would have to have these made, but they repay you, as cold is a thing of the past when wearing them.

Now as to gloves. You cannot do better than purchase a pair of bag gloves with the index finger free from the bag part, but be sure to get a pair that straps at the wrist. You will want a pair of similar gloves of light wool inside them.

For headwear I have never worn anything more cosy than a racing helmet, and I cannot recommend anything better;

but, attached to mine, however, is an adjustable flap that I can pull down at will to protect the eyes in rain.

To close. Do not forget a woollen muffler round your throat. This will keep the draughts from exploring too familiarly.

Never go out feeling cold. If you do feel cold stamp or run about until you feel warm, or try and start your engine on paraffin (I guarantee this will warm you), but do not go near a fire to get warm whatever you do. H.M.

## A Sporting Sidecar.

A Light Model specially produced for Low-powered Machines.

THE taking sidecar illustrated is the latest product of Cooper Sidecars, Belgrave Road, Balsall Heath, Birmingham. It is a light sporting body, suitable for fast, but comfortable, touring, attached to a low-powered machine. The chassis is of the simplest type, and, although very strong, is quite light. The main frame is formed with one main tube, bent in a triangular loop, which, when bridged at intervals and attached to the substantial axle which also forms the rear connection to the cycle, makes a strong yet light chassis. Three points of connection are provided. The body, which is, of course, the Cooper speciality, is very neat, and, while providing a very sporting appearance, is thoroughly comfortable. The back of the seat is not high, being, in fact, on a level with the front. The upholstering, however, is so arranged that a perfectly comfortable

The Cooper sporting model sidecar, a feature of which is the luggage space in the bulbous back.

riding position is rendered possible despite the shallow back.

The bulbous rear portion of the body

is not wasted space, as in so many sporting bodies, but accommodates a very roomy locker in a similar manner to that provided in the large touring body illustrated some little time ago. This locker, even on the sporting body, provides sufficient room for quite a large bag, while on the heavy model there is sufficient room for still more luggage. The bodies of both models are very neat, and it would be difficult to notice that so much luggage-carrying room is provided. Locker space is an important detail which makes a great deal of difference when touring, for not only is the luggage perfectly protected from the weather and road vibration, but it also overcomes the necessity for such careful packing and strapping, which is necessary when luggage is carried on a grid or carrier, besides being a very much neater way of carrying it.

## Vaporisation of Heavy Fuels.

More Suggestions from Readers.

WE continue to receive suggestions from readers for the vaporisation of heavy fuels. Many of these have been published during the past few weeks, and in this issue we give a few more. Though the allowance of petrol is to be increased next month, thousands of riders will still continue to use heavy fuels, and this, together with the approach of cold weather, makes it all the

more imperative to arrange for the proper vaporisation of whatever petrol substitute is used.

### Simplicity Itself.

A reader (R. Baker Whittick), who owns a Triumph, sends us a sketch of a vaporiser he has fitted with satisfactory results. It consists, firstly, of a tube attached to the air intake of the carburettor, and bent round so as to catch the hot air coming off the cylinder fins. Round this pipe a tin cover was fitted, which brings additional heat direct from the exhaust. This was accomplished by fitting a small pipe from the cover to the exhaust outlet, as shown in the sketch on the left.

### From a Boot Polish Tin.

That a satisfactory vaporiser can be easily and cheaply made at home is proved by the device illustrated, and rigged up by a Coventry reader, J. Robert Reid. It consists of a Nugget boot polish box, which, after a large hole has been made in the centre, surrounds the float chamber. It is soldered top and

bottom. A pipe brings heat from the exhaust, and then, if desired, the outlet pipe can be taken to the air intake and so warm the air drawn over the jet, and assist in spraying the fuel.

This device is fitted to a Rudge-Multi, with Senspray carburettor, and Mr. Reid tells us he gets good results with a mixture of 75% paraffin and 25% petrol. He has to prime with petrol for starting from cold.

R. Baker Whittick's vaporising device for heavy fuels.

A vaporiser made from an empty boot polish tin.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

#### What Soldiers Like.

Sir,—I thought perhaps you might like to know how much your paper is appreciated out here in France. I was originally enlisted a gunner in the Motor Machine Gun Service, and, after a somewhat varied career, am still alive to look forward every week to my copy of *The Motor Cycle* that is sent out from "Blighty."

For my own part I very much enjoy the illustrated articles of trips through different parts of Great Britain. And I would suggest, now that there is rather a "close" season in motor cycling, that the large numbers of your Service readers at present abroad would thank you for a liberal supply of such articles.

A few photographs that recall to us pleasant visions of a sunlit road and the happy times we had (and hope to have again *après la guerre*) are, like "Fragments from France," a fine tonic to cure "fed-upness."

I may say that I was quite surprised at finding it was possible to buy current copies of your paper within a couple of miles of the firing line.

B.E.F.

W. H. LETHEREN, Sec.-Lt., R.E.

#### Economical Management of a Scott.

Sir,—I was much interested in the article which appeared in your issue of September 14th, as I, too, had been experimenting with a 1912 Scott, which had been brought up to date in much the same way as the machine of the writer of the article. Before the above-mentioned article was seen the two fittings shown in the accompanying illustration had already been completed. The auxiliary tank, holding about half a gallon of petrol for starting purposes, was made out of a Macfarlane water-biscuit tin, the length being reduced by about 3in. It was attached to the tube by ordinary iron "hooping," which is used to strengthen the ends of wooden cases, etc. A bracket was also soldered on to the bottom of the tin, as there was a tendency for the "tank" to vibrate at high speeds. The total cost of making this, with tubing, T piece, and filler cap was under half a crown.

Scott equipment for using heavy fuel.

For the hot air intake the same method was used as that mentioned by the writer of your article—the most obvious and perhaps only method for a Scott machine. In my case, however, ordinary copper tubing was used instead of flexible tubing, as being cheaper. It might seem as if the length of the piping would spoil its efficiency;

but, as a matter of fact, not only does the jet chamber and induction pipe become thoroughly warm after a few hundred yards, but also the float chamber and its contents.

The fuel used is a half-and-half mixture of petrol and paraffin. The Scott runs as well on this as on pure petrol, no difference in speed, hill-climbing, etc., being noticeable. Pure paraffin was tried, but the engine "choked." This, in my opinion, is partly due to the number of gauzes through which the mixture has to pass before it reaches the combustion chamber. Only one thickness of gauze is used now, instead of the usual two, and, possibly, if all the gauzes were dispensed with the machine would run on pure paraffin. With petrol one gets objectionable "blow-backs" if the full number of gauzes is not used, but these disappear when paraffin is used.

(REV.) V. B. YEARSLEY.

#### Electric Lighting for Motor Cycles.

Sir,—With reference to Lt. Nagel's criticism on the use of celluloid-cased accumulators mentioned in my article on the above subject, I have used this type of cell continuously on various motor cycles for the last three and a half years without the slightest damage taking place. On my latest two-stroke (a 1916 model) a C.A.V. celluloid type cell, mounted in precisely the same position as his own, has already seen considerably over 1,000 miles' use on rough roads, and it is practically impossible to distinguish it from new.

The advantage of celluloid is that it enables the condition of the plates and height and condition of the acid to be readily observed, which is a great factor in the successful use of accumulators for lighting purposes on motor cycles, especially when one is dependent on the local garage for charging facilities.

With the steel or ebonite-cased cell the internal condition is largely a matter of guesswork. Provided the celluloid cell is of a good make and is tightly packed in its box to prevent jolting, I fail to see why it should be more prone to damage than any other type. F. E. SCHOFIELD.

#### American Machines.

Sir,—I quite agree with "Rhodesian" in his tip for overhead valves on the Indian. I have also found it quite an improvement, and, with the addition of a small fibre cap over the small push rod it makes the valves as silent as side by side.

But I should like to make a few remarks regarding the wearing qualities of this machine in contradicting "Prospero's" statements. I uphold him in his points on other machinery, but would like to give my experience as regards two of the principal motor cycle productions.

(1.) The clutch and gear box of the Harley-Davidson and Indian will take a lot of beating. I have just examined and cleaned a 1913 7-9 h.p. Indian two-speed gear box and for all practical purposes it was in as good condition as the day the machine was put on the road.

(2.) Engines. Three weeks ago my pal in the workshop dismantled an 8 h.p. three-year-old Harley-Davidson engine. It had one cracked piston, and the rings were bad, otherwise nothing else required renewing. This machine had been run hard by one who did not know a piston from a big end, and had had a sidecar attached the whole of the time.

I have just assembled my 1915 5-6 h.p. engine after a complete inspection. This machine has run about 12,000 miles. All it required were two new top rings and a good internal

cleaning. I, of course, had the heads off for decarbonising purposes.

(3.) Wheels and frames. Where can anyone find wheels which will stand up any better than the American pattern? The frames also may bend in a smash, but very seldom crack or kink.

(4.) Brakes. How is it I notice some of the latest British machines of good makes are beginning to copy the American back drum brakes? MECHANIC M.T.

Sir,—“J.W.’s” letter requires an answer from me. To have it suggested that my opinion is the possible result of intolerable bias by a gentleman who naively admits his own bias is sarcasm run mad. He has “lately” taken delivery of so and so. Precisely my point. Mr. J. W. Walker’s point and “Ixion’s” concise summary of the question (*vide The Motor Cycle* of August 24th, page 154) are all summed up in the sentence in Mr. Walker’s letter: “Very fine for three, passable for six, and hopeless for a year’s hard riding.”

To answer question No. 2. Yes; American kick-starters are more crude than English. Where is there an American with a kick-starter as neat as the Sturmev-Archer, Sunbeam, or A.J.S.?

Point 3 would be a list of annoying troubles petty and otherwise—the natural result of having a collection of small nuts, bolts, studs, pipes, and flimsy levers placed on a vibratory piece of mechanism like a motor cycle engine. I would advise “J.W.” to cast his eyes around and not glue them to one machine.

Electrical troubles. To re-utilise an old phrase of my own, “Magnetos that are too proud to spark” hail in large quantities from across the herring pond. We have some here (France).

Point 4. A carburetter is not automatic if it requires a small extra air lever to be manipulated from the saddle by leaning down and feeling for it. My present Triumph carburetter is more automatic than any American I ever sat on, yet it is a two-lever.

Point 5. My list was not meant in any way to be authoritative or complete. As stated, it was a purely personal short list of really good things—the result of a fair amount of riding experience. I would point out that there are several English machines which will give him all the good points he enumerates, bar possibly 28in. wheels, and I would further point out that the home product will still be giving excellent service a year or so after the average American has rattled itself to the scrap heap.

B.E.F. A. LINDSAY, M.B. (CAPT.), R.A.M.C.

P.S.—Capt. R.G.A. was your error. *N’est ce pas?*

#### A Trial of Petrofin.

Sir,—Having run 400 miles on Petrofin, I give my experiences. No alterations have been made in any way. The machine is a 1914 2½ h.p. Douglas, Amac carburetter. I fill the carburetter with pure petrol, inject pure petrol into each cylinder, turn on Petrofin, and the engine starts at once.

I get over 84 m.p.g. The following differences are noted between petrol and Petrofin:

The engine takes little air until six miles have been run.

The engine is very sensitive on throttle and as to mixture, and slow in picking up after corners, when it is apt to “pink” or backfire in the carburetter. When picking up after corners it starts firing on the back cylinder, then on the front, and possibly backfires in the carburetter. This is doubtless due to air leaks, as the carburetter is old. On the level the pleasantest speed is 27 m.p.h., with the throttle nearly shut and a little air.

As the engine runs hotter than with petrol it takes a little more oil. On hills it is slow, necessitating more frequent use of the low gear; but if allowed to cool first it goes up anything on top, as with petrol.

In conclusion, Petrofin is more tricky to drive with, as “it is strongheaded,” and gets a set mixture of its own, which must not be altered, of 27 m.p.h. or so. At this speed the engine keeps fairly cool: it will do 50 m.p.h., but naturally overheats soon. All the taxis in Cambridge run on white paraffin at 1s. 1d. per gallon and one-third petrol. They mix a penny block of camphor with each gallon of paraffin (as in London). I find my Douglas runs better on Petrofin with a penny block of camphor per gallon.

J. H. LAWSON-WALTON (LIEUT.),

13th K.R.R., ATTACHED R.F.C.

#### Improved Mudguarding.

Sir,—I have no desire unduly to deprecate Mr. Macgill’s mudguard attachments, described and illustrated some little time ago, but what I would like to point out or suggest is that such attachments would not be necessary if the present practically standard method of mudguarding were redesigned. Several years ago I urged two leading makers, whose machines I used, to fashion the mudguards on what I would term car style, *i.e.*, broad nine or ten inch guards, slightly curved, with small ribs along the edge to prevent water and mud from scattering out sideways. Such guards to have an inch of clearance from the tread of the tyre, thus enabling them to be easily cleaned out, and clogging up with mud and snow, so often the case with the present closed in form of mudguards, rendered impossible. My suggestion was politely acknowledged by the makers in question, but was not adopted. Since then I note that the Enfield and A.J.S. firms have begun to fit their machines with broad open guards, and recent Norton models have the back wheel thus protected, though retaining the old style of guarding over the front wheel (which, by the way, is the principal offender, so far as mud, dust, and wet slinging is concerned). It may be urged that the style of mudguards I advocate would mean wind resistance and overheating by the engine being too well shielded; but my experience with Douglas machines fitted with outspread wings on the front guard is that ordinary wind resistance is not apparent, and a series of perforations through the right hand wing enables a draught of air to impinge on the front cylinder, thus checking any tendency for the engine to become unduly heated.

Supplementary fittings, such as shields made of tin or leather, roller blinds, etc., I regard as so much clumsy, unsightly extra stuff clamped and bolted on, and more or less a hindrance when certain adjustments are necessary. The majority of makers at present are probably too busy with Government work to think about mudguards, but I hope, when normal times return, that those very important and all necessary fittings will undergo such alterations as will make them really effective. R. G. LINDSAY.

#### A Home-made Sidecar.

Sir,—Noticing from time to time the interest you take in home-built sidecars, I am sending you a photograph of one I built in my spare time. It is made of three-ply wood, has a V-shaped windscreen, and is extremely light. It offers very little wind resistance. I have attached it to my 1916 B.S.A. machine, of which I cannot speak too highly. I have fitted a “drain pipe” exhaust and altered the handle-bars to my own taste. I have been running on half paraffin and half petrol without any alteration to the carburetter. With this mixture there seems to be no difference in running, except on hills, when a little more careful manipulation of air and spark levers is required. It is only necessary to inject petrol when starting from cold. I give the engine just a little more oil than when running on “pure” petrol. I have examined the residue in the crank case from time to time, and can see no signs of the paraffin getting past the rings, so I should imagine that the half and half mixture vaporises properly.

G. P. RAMSEY.

Another home-built sidecar body. (See letter from G. P. Ramsey.)

### The Scott Sociable.

Sir,—I have been following with great interest the correspondence about the new Scott Sociable in your excellent paper.

In reply to Sgt. Way's idea of placing the front wheel in the centre, I would suggest that Mr. Scott's original idea was better, for, even in peace time, the roads in this country leave much to be desired, and on rough roads surely two tracks are better than three.

A point with regard to piston head design. Why is it motor cycle manufacturers insist, I think without exception, on making their piston heads nearly flat? Surely if the combustion chamber were more nearly spherical (see sketch), with the plug in the centre, greater power and

efficiency would  
E. PLANE.

Sir,—I have been very interested the last few weeks in reading the letters in *The Motor Cycle* with reference to the Scott Sociable. Whether it is a "beauty" or not seems to me to be matterless if it will prove to be as satisfactory and efficient as a standard 5-6 h.p. twin and sidecar. The motor cycle and sidecar was by no means beautiful when it first made its appearance, but it has proved to be the passenger outfit so far.

Some months ago, before the description of the Scott Sociable was published in *The Motor Cycle*, I saw a sociable which, if it were not the Scott, was its double—at least it had a two-stroke Scott engine, and was very like the description and photographs in *The Motor Cycle*, and bore the registration numbers of the district where the Scott is built.

When first I saw the machine it was standing in the left-hand side of a main street, with the front and driving wheel about a foot or so off the crown of the road, the offset wheel, of course, being nearer the pavement. The engine was started up with both driver and passenger in their seats, but when the machine was put into gear and a start attempted the sociable refused to mount the camber.

The same thing was tried several times, but without success, and to get away the passenger and driver had to get out and push or drag the front wheel on to the crown of the road before a start could be made. I never saw a motor cycle and sidecar in the same predicament, and have seen dozens start away from exactly the same place.

Why the sociable refused to mount the camber of the road I cannot say, but it appeared to me at the time to be due to the fact that there was too much of the weight on the back wheels, and the uneven pull of the passenger's weight made the front wheel lean over a great deal, and, however the steering wheel was turned, the front wheel refused to right itself to allow the motor to start off. I may add the camber of the road was by no means out of the ordinary. Perhaps this trouble has been remedied, as, in my opinion, it was a very serious drawback to the sociable. I do not wish by any means to run down the machine in pointing this out, but as many of my friends who witnessed the incident have often mentioned it (and more so this last week or two after reading the letters in your paper) an explanation would be welcomed. Personally, I think it only fair the makers ought to have the chance of explaining through the medium of your paper as to whether this has been remedied or not.

F. GREENWOOD.

### Will the Single-cylinder Survive?

Sir,—The "entirely new class of motor cyclist" which "Engineer" assures us has come along must be very small in numbers and influence compared with the class which will arrive when the Army releases its millions of men, and only after the war will the question of the survival of the single-cylinder be answered.

Of late years the policy of the motor cycle trade has been that of over-development in the search for comfort and luxury; that which is essentially the "poor" man's motor should be as comfortable only as is consistent with cheapness of first cost, economy of upkeep, simplicity of construction and control, and absolute reliability.

The single-cylinder is the only type to satisfy all these requirements, whilst the favoured of "Engineer" and, of late, your tame weather-vane "Ixon," secure comfort at the expense of cheapness, simplicity, and economy, and

88

maybe reduce absolute reliability to something a little less certain. The horizontal twin, gaining power only by abnormal r.p.m. and controllability by variation of gearing, cannot possibly equal the low fuel consumption of the single, which will do 90% of a day's work on top gear, thanks to the true engine flexibility and power which made possible the overwhelming success of the  $3\frac{1}{2}$  h.p. as a fixed geared solo.

Annually the cost of motor cycles has increased, simply because a certain class of motor cyclist has been in a position to pay for the increased comfort and luxury demanded; but such riders will eventually be in the minority, and it is but reasonable to suppose that as the price of an outfit equipped as they desire almost approaches that of a small car, the small car maker will eventually secure their custom.

After the war the small tradesman and the young artisan will form the backbone of the motor cycling public, and power with economy and reliability will be in most demand. This state of affairs has obtained for some time in the manufacturing districts of the North of England, and it is significant that here the single far outnumbers all other types for both sidecar and solo use.

D. H. SMITH.

Sir,—May I add a word for the twin? Mr. A. C. Huskinson, in his enthusiasm for his new single-cylinder mount, makes a most ridiculous statement in regard to the pulling power of the horizontal twin. What manner of twin has he in mind that requires a 9 to 1 gear to climb a hill that a 500 c.c. single can climb on a  $4\frac{1}{2}$  to 1 gear? Any decent 500 c.c. "flat" twin should climb the same hill as the single on a 5 to 1 gear.

May I relate a few instances of hill climbing by twins known to me? During the hill-climbing meeting at Nailsworth in February last George Brough made several ascents of the "Ladder" on a  $8\frac{1}{2}$  to 1 gear. This was on a standard  $3\frac{1}{2}$  h.p. Brough. This machine was not one of his "specials," but a standard machine belonging to a customer. In the 1914 Jarrott Cup trial Brough and I both rode  $3\frac{1}{2}$  h.p. Broughs. George Brough's gears were  $6\frac{1}{2}$  and 4 to 1, if I remember rightly, and my own  $7\frac{1}{2}$  to  $4\frac{3}{4}$ ; yet we had no difficulty in ascending all hills, and I was told afterwards that our machines were among the fastest on the hills, and some of them are pretty stiff. Another case of a good climb was made by a 1912 fixed gear  $2\frac{3}{4}$  h.p. Douglas that used to belong to my friend, G. L. Rossiter—well-known to Portsmouth Road habitués—which climbed Pebblecombe on a 6 to 1 gear; also on my Brough I have climbed Dashwood Hill with a  $4\frac{1}{2}$  to 1 gear at over 25 m.p.h.

Why does Mr. Huskinson imagine that a twin with worn out chains, sprockets, gear box, and with the engine getting "slack" will make more noise than a single in a like condition? I should say that the single, provided it is fitted with the same type of transmission, will make a much more horrible row, with its uneven power thrusts jerking the worn chains, etc.

Mr. Huskinson thinks that running an engine on lower gears will wear it out quicker than hanging on to high gears. My experience has always been that more wear takes place in an engine and transmission on a fixed gear machine, or where a high gear is used a great deal. It is the thumping at low engine speeds that wears out the bearings, transmission, etc.—not "revving." I have been running my own machine for over eighteen months, and have covered well over 8,000 miles, and the bearings—big and little ends—have not yet required taking up.

I have ridden most types of power units and the Brough horizontal twin for the last two and a half years, and my conclusion is that the horizontal twin is the finest type of unit for a motor cycle it is possible to have. The increasing number of famous motor cycle houses to take it up is a good argument for this. All credit to the pioneers, Douglas Bros.

I hold no brief for any motor cycle firm, but just state my experiences.

K. V. CHIDLEY.

### Treatment of Belts.

Sir,—Now that a lot of motor cycles have to be stored away, owing to "joining up" of the owners, it will be found a very wise plan to remove the rubber belt. If the belt is not taken off the machine it will be found (after a few months), with being kept stretched for so long, that the rubber covering will be cracked. This will follow with it peeling off, and end in buying a new one, whereas if it were put away in a cool, dry place it would remain as good as ever.

J.D.R.

**Why Does the Engine Carbonise?**

Sir,—I always find your journal most interesting, and feel compelled to extol the article by Mr. H. Webster Moss on "Why Does the Engine Carbonise?" in *The Motor Cycle* of October 12th.

The points raised and reasons given appeal to me as a chemist. I am inclined to think that the mischief arises more from the lubricating oil than from the petrol, and should imagine that petrol engines would show this defect more than petrol worked ones.

Why lead an exhaust heated pipe through the induction pipe? It seems to me that a larger exhaust as a jacket all round the induction pipe should be more effective, and could be made to improve the "silencing" in running.

I often think that the principle of a scent spray could be better adapted to the jet to relieve the trouble of flooding.

Why not fix a small metal piston near tank with a pipe leading to a small container of petrol near carburettor with an outlet inside jet chamber? This would give a vaporiser of much finer divided particles than ordinary jets. This should start up more easily with foot on pedal and hand on piston.

Had I time and tools I should be inclined to experiment in this direction.

W. PILKINGTON.

**Paraffin—A Suggestion to Manufacturers.**

Sir,—I should like to seize the opportune moment of communicating a very important suggestion, through the medium of your valuable and widely read paper, to motor manufacturers throughout the country, strongly urging them to adopt the "dual system of paraffin and petrol" for use on all their trade carrier machines, and also on their general runabout machines, and even, to extend my suggestion further, use this for all testing purposes, etc., since it has been proved and found that there is very little loss in general efficiency in running engines on paraffin. During these days of urgent necessity for economy in the use of petrol, I feel convinced that this suggestion would mean a great saving of petrol, since there is at the present time an enormous quantity of petrol being used for the above purposes which might, I think, be easily avoided.

There are various methods of carrying this suggestion into simple practice, the simplest, I think, being one in which a small compartment or a separate tank is used to carry the petrol for starting-up purposes only, and a two-way tap or the like employed, so that either petrol or the paraffin may be turned on to feed the engine through the carburettor at will of the operator, and this might simply be arranged if desired for handle-bar control.

A. S. BAYLIS.

**Magneto Details.**

Sir,—Regarding your contributor "Ixion's" statement in *The Motor Cycle* of October 12th about sticking rocker arms on British-made magnetos, I should like to know why the fibre bush is still fitted.

Is it another instance of the hypnotising effect of the name "Bosch"? Now the reason I ask this question is because I have a 1911 3½ h.p. machine which has done over 38,000 miles, and although the contact breaker is similar to the Bosch, I have never had a stick-up. The magneto is German make, but has a metal-to-metal bearing for the rocker.

The same make of magneto had a still further improved contact breaker fitted just before the war. In this case the rocker was discarded altogether, and the platinum contact attached direct to a spring.

Then again there are the novel American magnetos. Now why cannot English makers exercise their originality, and realise that even the Bosch was far from perfect in regard to the contact breaker?

D. E. JEWITT.

**An Appreciation.**

Sir,—Some months ago I wrote to you about my Douglas, saying I did not think I could manage it, as the saddle was too high and the machine appeared to be rather heavy for me. On receiving your reply to the effect that you were quite sure that if the seat were lowered I could manage it, I took your advice, and have had some glorious rides since; not far at a time, it is true, because I happen to be a postal official, and the hours will not admit of my going a long distance in one day.

I have bought two of your handbooks. I always take *The Motor Cycle*, and read the articles published therein with great interest.

You have brought a great deal of pleasure into my life, for which I heartily thank you.

(Miss) BERTHA I. STUBBINGS.

**Mending Punctures.**

Sir,—I send you herewith a sketch of an idea which I have found very useful to me a number of times.

Sometimes when you get a puncture on a country road, the patch is inclined to be awkward and will not stick to the tube, but by using an ordinary adjustable spanner as a cramp you can obtain a good mend. All that is needed are two pennies. The sketch will explain the idea.

J. D. ROBINSON.

**Engine Noises.**

Sir,—From time to time an outbreak of explanations of "konking" and other weird engine noises takes place in your columns. Most of the theories given have been palpably wide of the mark, betraying as they do a complete ignorance of the simplest chemistry and mechanics; others are possibilities, but I have never noticed mention of what in all probability is the true reason, viz., "rupture of the lubricating film at the moment of maximum pressure," most particularly at the gudgeon pin. The conditions of konking favour (1) a high instantaneous pressure on the piston; (2) extreme attenuation of the oil from high temperature; (3) a thin film, because of slow relative motion between the surface of the gudgeon pin and of its bearing in the connecting rod. Hence rupture of the film.

When the explosion occurs the film is driven away, broken through, and a momentary metallic blow of the "konk" kind is probable; a short semi-seizure is sure to follow from the increase of friction. This results in a greater or less retardation of all the moving parts, which opens up the way for an easy explanation of all the noises described by your readers.

From observations made on a cycle engine of my own, very liable to knocking, I came to the conclusion that the highest note was produced when the action took place in the gudgeon pin, the next when the connecting rod end momentarily broke through, and occasionally a kind of compound "chug" occurred in the main bearings. At any rate the idea is worth considering and testing by anyone with the requisite leisure and learning.

OLEOFIEND.

**Overheated Sparking Plugs.**

Sir,—I have read "Ixion's" remarks re overheated plugs in *The Motor Cycle* of September 7th with considerable interest. A short time back an appreciative comment on the A.B.C. machine appeared from the same writer. I had looked forward to this report, as I was anxious to know whether any plug trouble had been experienced with the engine under review, but apparently this make has not even one small fault.

My present mount is a T.T. Brough—a fast and reliable machine—but I find that plugs do not last long. At moderate speeds they are quite satisfactory, but when the "fifty" mark is passed misfiring soon begins, and on examination I find that oil is working out between the porcelain and metal body of the plug. The central electrode can also be moved about, but as soon as the engine gets cold it sets tight again and the firing is perfect for a few miles. On one occasion the centre of the plug blew right out when travelling at speed. The plugs used have been of best English make. My engine is perfectly clean and in good order, and the timing must be about right, as I can touch 60 m.p.h. by speedometer. The front cylinder is guilty as often as the back. Perhaps some of your readers have had similar bother, and have found the remedy, i.e., a plug which will stand up to the work.

ROBERT J. COSH.

# CURRENT CHAT

## Time to Light Lamps

Oct. 19th	...	...	5.29 p.m.
" 21st	...	...	5.25 "
" 23rd	...	...	5.20 "
" 25th	...	...	5.16 "

## Special Features

COLD WEATHER CLOTHING (illus.).

BEARING PRESSURES.

SIDECAR OR CYCLE CAR?

### Rather Late in the Day!

A new feature introduced into "Pell Mell," the revue at the Ambassadors' Theatre, is a satire on the Petrol Control Committee.

### Overseas Markets.

The Cleveland two-stroke—the American lightweight which follows so closely the design of the 2½ h.p. two-stroke Triumph and the single-cylinder F.N.—is the latest motor cycle to seek a footing in Holland, an Amsterdam agency having been opened.

### The Term "Flat Twin."

Under the heading "A few Spare Links," E. B. Holton, writing in an American contemporary, says: "Here's one from the other side, and, as it is good, I hope we adopt it into our own lingo. It is the English appellation for a double opposed motor, and is 'flat twin.' The beauty of it is that it fully describes the type, and at the same time is short."

### Police Trap at Aldershot.

We are informed that there is a police trap working almost daily in Queen's Avenue, Aldershot, between the Canal Bridge and North Camp, in the twelve-mile limit. The military police summon all offenders, both civil and military, and the cases are dealt with at Aldershot Police Court. Fines are generally 15s. or £1. Numerous D.R.'s have been caught recently.

### More Cheap Cars.

The Autocar informs us that there are reports in France concerning the formation of a company, with a capital of £3,000,000, to manufacture cheap cars after the war capable of competing with the Ford. We frequently hear vague talk of an amalgamation of companies in England to turn out motor cycles in vast quantities, and at prices unheard of; but we do not think cheaply manufactured motor cycles would benefit motor cycling in England, though it might for a period popularise it.

### A Curious Coincidence.

On the very day previous to our leading article appearing in the last issue on the British magneto, in which it was stated that neither individually nor as a body have the British motor cycle manufacturers expressed their determination not to use foreign magnetos after the war, it was announced in the French official report that Adjutant Pilot Baron and Adjutant Chazard had bombed the Bosch magneto factory in Stuttgart. Dense smoke was seen rising from the factory as the result of the bombardment. The French are evidently in earnest about this matter, even if the British are not.

### A One-handed Motor Cyclist.

Mr. Nelson, of Shipley, who, unfortunately, has lost one hand, which is replaced by a hook, writes us in reference to the R.F.C. At present he rides a 4 h.p. Norton motor cycle, and can manage motor cars as well. He has offered his services for Motor Transport and been refused, and has also been rejected three times by the military.

### Obscured Number Plates.

A correspondent informs us that police are active in Regent's Park Road, North Finchley, and are especially keen on catching motor cyclists whose number plates are obscured. Two constables are employed on this important duty. Our informant was stopped for having his number plate partially obscured by a cloth he had wrapped round his spare petrol can to prevent it scratching the enamel on the carrier.

### Driving by Night in London.

No one drives a motor vehicle by night in London unless he is compelled, though sometimes it happens that one is overtaken by darkness, and the ordeal has to be faced. Then excessive caution has to be exercised. Foot passengers crossing the street are next to impossible to see, motor omnibuses and trams are hardly noticeable, so dimly are they lighted, and overtaking is risky and uncertain. The driver has to keep his eyes skinned the whole time and must drive very slowly.

### Three for Free.

From the small advertisements of a daily paper: "¾ h.p. motor cycle and sidecar for sale, 4-stroke, 3 engine, 2-speed, in going condition."

### A Natal Trial.

The Pietermaritzburg Club's annual trophy run, a matter of 157 miles over typical Overseas roads, was won by an A.B.C. rider, who lost eight marks out of one thousand. Thirteen of the twenty-three riders were mounted on big American twins.

### Latest Lighting.

We are glad to see the official order that, commencing January 1st, all vehicles, except bicycles, push tricycles, and hand vehicles, will be required to show two front lights, one at each side. It is already compulsory in certain counties. The extension of restricted lighting on vehicles to the whole country is described elsewhere in this issue.

### Second-hand Machines.

Now that more petrol is obtainable and fewer new mounts are to be had the second-hand trade should be brisk. As it is more and more difficult to get repairs carried out, motor cyclists will have to rely still more on their own skill and resourcefulness, and we advise those who contemplate overhauls during the winter months to read all the books they can on the management of their mounts.

Prince Axel of Denmark is a keen motor cyclist, and scorns the lightweight, preferring the speed and power of the 10 h.p. Harley-Davidson, on which he is seated.

**The Motor Cyclists' Round Table.**

Our correspondence pages, which extend to four pages this week, are exceptionally interesting.

**The Admiral Arbuthnot Trophy Fund.**

A cheque for 5s. having been sent to *The Motor Cycle* by Lt. Frank May, R.N.A.S., for the Arbuthnot Trophy Fund, Mr. T. W. Loughborough, secretary of the A.C.U., has decided to accept it. This is the sixth amount received by this journal and handed over to the A.C.U.

**A Machine Stolen.**

Messrs. Maude's Motor Mart are anxious to trace a machine which was sold against a cheque which has been returned "no account," the purchaser of which cannot now be found. The machine is a 1915  $3\frac{1}{2}$  h.p. Zenith, engine No. 2,426, frame No. 3,400, fitted with Watford speedometer, P. and H. lamps, and Lucas horn. Information should be sent to Messrs. Maude's Motor Mart, 100, Great Portland Street, W.

**The Second-hand Show.**

Owing to unforeseen difficulties, Mr. Hugh H. Gregory, who had arranged to issue the certificates stating the mechanical condition of the entries at the forthcoming show of second-hand cars, has, with great reluctance, been compelled to withdraw from this appointment. Messrs. William Glass and Company, the organisers of the show, have, however, succeeded in securing the services of Mr. G. Foster Pedley, who is well-known in all branches of the motor industry.

**The Auto-Cycle Union's Recognition.**

The Auto-Cycle Union has shown its approval of the forthcoming show of second-hand cars and motor cycles by reserving space for an office at the Royal Agricultural Hall. The Union was formed for the protection of motor cyclists, and is pleased to recommend the show to such of its members as are desirous of disposing of their machines.

Prospectuses of the show may be obtained from the secretary, William Glass and Co., Lincoln House, 296, High Holborn, London, W.C.

**Franklin goes to America.**

C. B. Franklin, one of the best known competition riders in Ireland, and who has on many occasions taken part in classic events on this side of the Irish Channel and on the Continent, is going to America to take up an important position on the mechanical side at the Hendee Manufacturing Co.'s factory at Springfield (Mass.) Before he entered into the service of the makers of the Indian as manager of the Irish depot of the company, Franklin followed the profession of an electrical engineer, and his skill in electrical matters was a contributing factor of no small account in his success in competitive events. Franklin will remain in America for a period of six months at least. Meanwhile, the Hendee Co. is closing temporarily its depot in Dublin, this step being made necessary owing to the restrictions regarding the import of foreign-made motor cycles.

**The National War Funds.**

At the week-end the principal war funds stood as follow:

The National Relief Fund	£5,964,924	0	0
(£3,465,925 distributed)			
British Red Cross Fund	4,478,396	0	0
Tobacco Fund	115,645	0	0
The Queen's Work for Women Fund	170,780	13	6
Kitchener Memorial Fund	331,000	0	0

**The New Lighting Order—A Wrinkle.**

In view of the new Lighting Order, which specifies that all sidecar combinations must show two white lights to the front, showing the full width of the vehicle, a few notes on the subject will be of interest. As the extra side lamp need not be used for illuminating purposes, but merely to show the width, a simple solution of the difficulty is to use an ordinary small tail lamp, substituting a white glass for the red one. If this glass is painted over with whitewash mixed with size the light will be sufficiently obscured, and will serve the purpose quite satisfactorily.

**Obtaining More Petrol.**

In our issue of October 5th a correspondent described how, in his endeavours to obtain petrol, his original application bringing no reply from the committee, he sought the aid of the A.A., and finally received three permits within eight days.

Our Scottish contemporary, *The Motor World*, quotes a case in which a car owner, finding his allowance insufficient, sent in two further applications, one for each of his cars, and a few days ago got what he asked for, which was a deal more than in the original permit.

A trick, which is a punishable offence, and not to be confused with the cases just cited, is that given in a recent issue of *The Light Car*. According to a garage proprietor, after he had entered the figure 2 (2 gallons of petrol) on a petrol licence the holder simply converted the "2" into " $\frac{1}{2}$ "! Needless to say, we do not recommend such a practice.

A LADY MOTOR CYCLIST ON GOVERNMENT WORK.

The machine is a lightweight Calthorpe two-stroke, which our correspondent finds of great assistance in her work for the Forage Department of the A.S.C.

**Motor Cyclist Volunteer Major.**

Congratulations to Mr. T. W. Loughborough, secretary of the Auto Cycle Union, on being gazetted a Major, commanding the 12th Battalion Surrey Volunteer Regiment.

**Sporting Light Cars.**

In yesterday's issue of *The Light Car*, Miss Viola Meeking describes a sporting light car body modelled on the lines of an aeroplane fuselage. The finished drawing looks extremely attractive.

**J.A.P. Parts.**

J. A. Prestwich and Co. have just issued two excellent booklets of spare parts. One covers the 4 h.p. and 5 h.p. twin engines and the other the 6 h.p. and 8 h.p. engines. They are both well illustrated and arranged for quick reference.

**Larger Tanks All Round.**

Our leading article, "The Desirability of Larger Tanks," must not be confused with the armoured car tanks. We believe, however, that the remark would apply equally truthfully to both "tanks" for warfare and tanks for the storage of petrol on a motor bicycle. We shall see!

**American Magnetos.**

Are we to see American magnetos made under German patents in this country in large numbers after the war? It is an aspect of the magneto question which must receive careful consideration by the authorities. We note that the Bosch Magneto Co. of America announces an enormous increase in the size of its factory with the object of multiplying the output.

**A Strange Order.**

We are advised that an Inland Revenue inspector called at a garage in the London district the other day, and informed the proprietor that all petrol substitutes if poured direct into the tanks of motors must be entered on the petrol cards. This is a strange ruling, and one apparently which may be at once overcome by selling the substitute in tins, for the agent then has no knowledge as to whether it is for use as a motor fuel, or for lamps, cleaning purposes, etc. Why dictate rules so easy of circumvention? We cannot believe that it is a general ruling.

**Bowden Brake Report.**

The report of the Bowden Brake Co., Ltd., after making allowance for depreciation, payment of directors' fees, etc., shows a net profit for the year ended August 31st, of £14,663 6s. 5d., as compared with £5,484 5s. 3d. for the previous year.

**Douglas Soldiers' Parcel Fund.**

We have received from Messrs. Douglas Brothers an interesting booklet dealing with the working of the Douglas Soldiers' Parcel Fund, the object of the fund being to co-operate in an endeavour to compensate in a small way their fellow workmen who are serving in the war. Seven hundred and thirty-four parcels have been despatched to one hundred and four soldiers with the British Forces. From January 8th to May 13th £197 was collected, which Mr. Douglas subsidised to the extent of £49.

## Birmingham to the Isle of Wight.

A Week's Tour on a  
2½ h.p. Lightweight Sidecar  
with Three Up.

**P**ERHAPS some would think it rather risky to go touring with three up on a 2¾ h.p. sidecar combination, but when I state that the power unit is a Peco, readers must realise that I had "some" engine, and indeed it performed its hard work admirably.

The Isle of Wight was our objective. I journeyed from Birmingham as far as Swindon alone, packing a little luggage securely in the sidecar to weight it and prevent it lifting on corners.

It was past midday before I started, and the weather was not very promising. Before reaching Evesham I ran into a heavy thunderstorm, and at Broadway I sheltered for an hour till the rain ceased.

Fish Hill, leading out of Broadway, is a nice little "pimple," but, using second gear, I easily ascended it. My way was then through Stow-on-the-Wold, Burford, Lechlade, Highworth, and Swindon, which I reached at 8 p.m., and found most comfortable quarters for myself and the machine at the Coventry Hotel in Newport Street.

### Two Passengers.

At about eleven o'clock next morning I met my good mother and a cousin who were to be my passengers. They had trained from Birmingham; so after rearranging the luggage and putting two cushions on the back carrier we made for Marlborough.

I proceeded slowly at first, as my cousin (on the carrier) had never travelled thus previously, and I wondered if she would be at all nervous, but I was soon at ease and we went merrily on.

I was curious to see how the little engine would tackle the steep hill at Marlborough (leading into Savernake Forest) with its load of about 26 stone, for I knew it would be the worst hill we should encounter this side of the Solent. There are two hairpin bends in the distance of about half a mile, and I fancy the gradient is somewhere about 1 in 8.

Owing to not dropping to bottom gear earlier, I did not get the best out of the engine. When nearing the second bend I decided to jump off and run about

twenty yards to ease the strain, and then, mounting again, we reached the summit feeling exceedingly proud of the performance. As we looked back, a lovely bird's-eye view of Marlborough was obtained, and the ride through the forest was enchanting. We passed through little hamlets with terribly long names, as, for instance, Collingbourne-Kingston and Collingbourne-Ducis. Here we turned right and then left by the church and on through Tidworth, Shipton Bellinger, Cholderton, Boscombe, to Salisbury. A good portion of this road Bartholomew calls "secondary," but it is decidedly picturesque, and that was why I chose it.

At Salisbury we stopped for replenishment, and after a peep at the cathedral sped away to Southampton, arriving at the pier at 4.30. Here the sidecar tyre went flat, and we had to wait till 6 p.m. for the boat. I mended the puncture on the pier; at least, I thought I had, but after getting the machine on the boat the tyre was down again. A rider of a Zenith very kindly gave me assistance, and by the time Cowes was reached we were ready to ride away. Another fifteen miles landed us with friends at Cranmore, near Yarmouth, very enthusiastic over our journey of about eighty miles.

While on the Island I had several runs, always "three up," and once with

four! One day we went to Totland Bay and Freshwater. On another we journeyed round Brook, at the foot of Mottistone Down, on the edge of which, and commanding a glorious view, is Brigadier-General Seely's fine stone mansion.

From here we got on the grass-grown military coast road, which proved exciting and novel, for we had to keep opening gates, and at one point we found ourselves in a field! However, we eventually got on to good roads again, and passed through Brightstone (pronounced Brigston), Shorwell, and on to Carisbrooke, inspected its grand old castle, then on into busy Newport, and back to Cranmore.

We visited Totland again, for it fascinated us. The views from the cliffs are glorious, and it was hard to leave the place—one of the Isle's fairest spots. I

The 2½ h.p. two-stroke Regal-Peco sidecar machine which was driven, with the load shown, by the writer, Mr. A. A. Smith, from Birmingham to the Isle of Wight.

**Birmingham to the Isle of Wight.—**

could have exposed many plates there if I had only dared, but owing to the war I had to keep my photography somewhat under restraint, for khaki was everywhere and cameras strictly prohibited.

**The Steepest Hill on the Tour.**

We also had a run to St. Catherine's Point—what delightful nooks there! Creeping at a snail's pace along the glorious Undercliff we arrived at Ventnor. It was, indeed, strange to see this lovely place so deserted.

Here we found the steepest hill of our tour—the one from the promenade up into the town; including two "hairpins" in its short length, it is indeed "a" hill. I shed my passengers at the foot and rode up with the sidecar empty. I didn't like the idea of perhaps having a stop half-way up. At the garage, where I procured petrol, amazement was expressed at my boldness in travelling "three up" on so small an outfit, but I put it down to their ignorance of the power of two-strokes. Many high-powered engines, they told me, had failed on that hill. The climb out of Ventnor to Bonchurch was very steep, and caused me to jump off and run a few yards.

We followed the delightful coast road to Shanklin and Sandown, then branched off inland to Brading and on to Ryde, and "home" *via* Newport—a run of fifty miles.

When we finally left the Isle of Wight for home, we crossed the Solent from Yarmouth to Lymington, a distance of only four miles, yet the charge for the motor cycle and sidecar was 3s.—is. more than the Southampton-Cowes route, which is treble the distance!

The run through the New Forest to Salisbury was delightful. We saw a great many soldiers, and many a joke passed between us.

**Two Polite Signs.**

By the way, how polite some of the motor signs are in the Forest. At one village we were requested to "Please drive slowly." We did; and then the next sign greeted us with "Thank you."

Owing to more tyre troubles we had to make two days of our journey back to Birmingham, for at 8.30 p.m. we found ourselves at Highworth, near Swindon, and stayed there for the night.

The week's run was 460 miles, and I used nine gallons of fuel, which works out at just over fifty miles to the gallon—not at all a bad average considering the load. I used a 30 jet in my Senspray. I also lowered my gear for the run, having ratios of  $5\frac{3}{4}$ ,  $9\frac{1}{2}$ , and 14 to 1.

Altogether the tour was very enjoyable, notwithstanding tyre trouble, and it proved also that it is *not* necessary to possess a high-powered engine to travel "three up."

A. A. SMITH.

ACTIVE NORTH-COUNTRY  
MOTOR CYCLISTS

The motor cycle section of the Liverpool Heavy Car Battalion of the National Motor Volunteers on their weekly turnout last Saturday. The section is a growing and important one, and though on Saturday the weather was bad in the extreme, it will be seen that a good number gathered for training. (See next page.)

## North-country Motor Cyclist Volunteers.

### ACTIVITIES OF THE LIVERPOOL M.C. SECTION.

#### SATURDAYS INSPECTION OF THE MOTOR CYCLIST VOLUNTEERS.

The motor cycle section of the Liverpool Heavy Car Battalion of the National Motor Volunteers lined up for inspection on the outskirts of the city.

THE present strength of the Motor Cycle Section of the Liverpool Heavy Car Battalion of the National Motor Volunteers is approximately seventy. Manœuvres are held weekly, and great enthusiasm is evinced. The Section is separate from the squadrons, and forms a unit of the battalion. The Commandant is permitted to make his own arrangements for drill, lectures, etc. Quite recently there was an inspection by Col. Smith, the County Commandant, fifty men putting in an appearance. It was generally admitted that the men were extremely smart, which is understandable in view of the fact that they all own the machines they ride. Col. Smith complimented the Section and its

officers on their appearance and keenness. Sports and a gymkhana held recently to support the funds of the Section produced nearly £40.

All the men pay a nominal subscription (voluntarily) of 1s. per month, N.C.O.'s double, so that the Section is on a self-supporting basis. Some of the men who have businesses of their own are able to assist the Section in many ways; for instance, a building supplies contractor lent the unit, free of charge, a piece of ground 500 superficial yards in extent, and has promised to put up a small drill shed and mechanical quarters. H. W. Coopland is showing a lively interest in the unit, and has been appointed honorary motor cycle section

commander. The Area Commandant, E. H. W. Butterworth, has presented the Section with a fine silver rose bowl on a plinth as a challenge trophy to be allotted at the discretion of the Section officers.

Some idea of the varied character of the members may be gathered when it is mentioned that among the ranks are gas-fitters, electricians, joiners, solicitors, and business men. Also included in the ranks are the Liverpool amateur heavyweight boxing champion and the Liverpool City football goalkeeper. With S. W. Phillpott, whose energy is well known, at the head of affairs, the Liverpool Motor Cyclist Volunteers are among the most virile in the country.

#### MOTOR CYCLE RACING IN SPAIN.

WE have received an account of a motor cycle race which took place in the Paseodel Principe and Boulevard, Almeria, Spain. The course was 152 kilometres, and the competitors were sent off at intervals of five minutes. M. Herrera, mounted on a New Imperial motor cycle, was despatched first, and, finishing the course in 71 mins., easily proved to be the winner. Jose Martinez, on an Alcyon, came in second, and took 15 mins. longer to cover the ground.

We are always pleased to hear of such successes; it shows that the British makers are still endeavouring to hold the market abroad, and are putting good material in the goods they do send out. It is by superior workmanship and durability that we shall keep our Overseas trade, and nothing will be more beneficial

to us than to see a single British machine coming out on top against a crowd of foreign makes.

#### NEW PETROL LICENCES.

IT is stated that with reference to the new petrol licences no delay is likely to arise in their issue. We hope that will be the case, for we had numerous complaints of annoying delays in the early days of the issue of petrol licences. Mr. Runciman tells us 100,000 persons wrote complaining of inadequate allotment, but later stated that if the present rate of importation of motor spirit is maintained the supply will probably be sufficient to meet requirements for the purposes of the war and other essential needs. Most motor cyclists will be aware by now that they may have four gallons a month after the expiration of their original licences.

#### HARLEY-DAVIDSONS FOR RUSSIA.

THE Harley-Davidson Motor Co., Ltd., have just completed, through their London headquarters, an order for over 300 sidecar outfits, several thousand tyres, and a big stock of spare parts for the Russian Government. The whole consignment was shipped within three days from receipt of order, we are told.

The new charges decided upon by the Hull Corporation for the use of the new electric derrick for transporting motor vehicles to and from the Hull-New Holland ferry steamers are: Motor bicycles, 6d.; motor bicycles with sidecars, 1s.; light cars up to 10 cwt., 1s. 6d.; touring cars, 2s.; limousines, etc., 2s. 6d. All possible damage to vehicles and other risks have been covered by insurance by the association.

## MILITARY NOTES.

## "The Credit for the Tanks." How Many People does it Require to Invent a Tank?

IN the House of Commons on Thursday last week, Mr. Lloyd George gave the following explanation:

A great deal has been said in the press about the service of these extraordinary machines, and I do not think I could serviceably add anything to what has already appeared on the subject. We are very satisfied with our experience of these machines. There is no doubt they have been a very considerable success, and, as they improve with experience, I have no doubt they will render even greater service than they have done in the last few battles. I was asked to whom the credit is due for this invention. I have already expressed my opinion on that subject, and I have no reason to vary it in the least, but perhaps there are one or two whose names I should specifically have mentioned. There were the Admiralty experts, whose services were so invaluable in designing these machines. Mr. D'Eyncourt, chief naval constructor of the Admiralty, probably had the greatest share in the matter of designing this formidable weapon. I should perhaps also have mentioned Sir Maurice Hankey, secretary of the War Committee, to whom we are very considerably indebted for the first suggestion that something of this kind should be tried. I still say that these suggestions would never have fructified, had it not been for the fact that my right honourable friend the member for Dundee (Mr. Churchill), who was then First Lord of the Admiralty, gave practical effect to them by making the necessary experiments, setting up committees for carrying the suggestions into effect, and by putting the whole of his energy and strength towards materialising the hopes of those who had been looking forward to an attempt of this kind.

Col. Norton Griffiths: Had not Col. Swinton a good deal to do with them?

Mr. Lloyd George: Oh, yes. I mentioned him in the statement I made in the press. He had a good deal to do with

Lt. Frank May, R.N.A.S. (on the right in the upper picture), is still faithful to *The Motor Cycle* and the A.J.S. machines. In the pre-war days he was a very keen amateur rider, his favourite mount being a 2½ h.p. A.J.S. Apparently the latter has been replaced by a 4 h.p. twin of the same make.

the experiments at the start. He was a most enthusiastic promoter of the idea, and the fact that it was carried through with such zeal was largely due to the enthusiasm he threw into the work. The same applies to Major (now Colonel) Stern, whose practical business ability was invaluable in securing the manufacture on a large scale of these engines of war.

## The Censor in the Nursery.

The secrecy about the "Tanks" is very disturbing to a certain section of

our trading community. A toy manufacturer in a large way of business tells me that he has had scores of applications from retail toyshops for working models of a "Tank." The British boy of today has no use for peace-time toys. He is all for aeroplanes, and airships, and machine guns, and now, too, he wants a "Tank"—and won't be happy till he gets it.—*The People*.

## What about the Men Inside?

And now that Mr. Lloyd George has made an attempt to relegate the tanks to their proper place in the scheme of war, may we be allowed a surcease of exploitation in this particular area? Let us remember that it is the men who are winning us this war. Tanks would not win it in ten centuries.

## Motor Cyclists manning the Tanks.

Another batch of men originally recruited for the Motor Machine Gun Service and examined by Mr. Geoffrey Smith, editor of *The Motor Cycle*, have volunteered for service in the Heavy Section, M.G.C. — the section which handles the heavy armoured cars now commonly known as "tanks."

## NEWS OF OVERSEAS MOTOR CYCLISTS.

MR. ALEC ROSS has received a card from Cpl. A. J. Sproston, who, as we have already announced, is recuperating in a hospital in Southern India from the effects of the Mesopotamian climate. Under the date of September 7th he writes that he is almost his old self again and in a beautiful district 6,000 feet above sea level, where there are good roads and many motor cycles. The latter, Sproston says, are mostly two-strokes.

Mr. H. R. W. Moss, A.S.C., has been good enough to send us a copy of *On Service*, for September, of which he has been editor since its inception.

We congratulate J. Chater Lea, jun., on his promotion to the rank of captain in the A.S.C. He has been doing excellent work in this corps in France since almost the very beginning of the war.

## MOTOR CYCLIST VOLUNTEERS AND THE WAR OFFICE.

Members of the National Motor Volunteers, London Section, with an A.J.S. sidecar and Zenith motor cycle respectively. The good work of the Volunteers is likely to lead to official recognition by the War Office in the near future.

## A NEW GRADO VAPORISER.

A Simple Method of Heating both the Fuel and the Mixture.

THE use of paraffin as a fuel to replace petrol necessitates the use of some extra device to facilitate its vaporisation, and the past three months has seen the introduction of a small army of inventions and suggestions, all, more or less, successful.

Practically all of them follow the idea of heating the fuel on its way to the carburetter, or between the carburetter and the engine.

### Double Heating.

The latest attachment is the Grado, made by the Grado Manufacturing Co., Pershore Street, Birmingham, already well-known as the makers of the "Grado" Multi-pulley. It is more ambitious than many devices we have seen :

Grado vaporiser, between carburetter and inlet valve.

Sectional view of the Grado vaporiser.

not only does it heat the fuel on its way to the float chamber, but the mixture is reheated in its passage to the engine.

From our illustrations it will be seen to consist of a brass tube conveying the fluid fuel, around which is a second tube for the passage of a portion of the exhaust, thus effectively warming up the paraffin. After passing through the carburetter, the mixture returns through a screen of small holes, and, impinging on the outside of the exhaust jacket, passes on into the induction pipe. This method of double heating, combined with the usual partial vaporisation by

the carburetter, should transform the liquid paraffin into a perfect vapour. The construction is good, the outer case being an aluminium casting, and the whole is readily detachable for cleaning purposes.

### Easy to Fit.

All the fitting that is necessary is a small pipe from the exhaust and the connections to tank and carburetter. A petrol injection is needed to start the engine, and a small tap is provided for this purpose over the induction pipe manifold. We have had no opportunity of testing this arrangement, but we understand it has given very good results, and it should prove an effective aid to the use of paraffin and the many heavy fuels which are now sold under different names.

## METROPOLITAN POLICE TRAPS.

THE police in that extensive district known as the Metropolitan area are more active than ever against motorists. We have received information of a police trap in Barnet towards the end of the ten-mile limit, on the Elstree Road (a road of secondary importance), beginning a few yards west of the church. The situation of the trap is in a wide highway where there is little traffic. Two traps are worked in the Cromwell Road, South Kensington, one near the Brompton Oratory and the other beginning about 100 yards west of the Gloucester Road crossing. Then there are other traps, one in the village of Roehampton and one on Surbiton Parade, situated by the gardens leading down to the riverside. A favourite control is often working near the Albert Hall, in Kensington Gore, in which many victims are caught. The first three of these traps were working on Saturday last.

All these are placed where there is no apparent danger and there is a temptation to exceed the limit slightly, especially when there is little traffic. Special constables who are motor cyclists or car owners should remember that by joining the Special Constabulary they release officers of the regular police force for this un-English practice. If there were

no specials there would probably be no traps. A page of *The Motor Cycle* would hardly suffice to deal adequately with the police traps in the Metropolitan area, and many and varied would be the tales of woe revealed.

Section of the Barry floatless carburetter.

## A FLOATLESS CARBURETTER.

THE carburetter we are about to describe is not on the market at present; it is none the less interesting. Mr. Barry, of Rathmines, the inventor, tells us that it has improved the consumption of his car from 32 to 45 miles per gallon, and, that being the case, there is no reason why it should not give equally satisfactory results on a motor cycle.

As there is no float chamber, the supply of petrol is controlled by a needle pressed by a spring on to the jet, which has a conical seating. A disc is attached to the needle to enable the suction of the engine to lift the needle from the jet, and as the motion increases with the speed the needle is lifted higher and more petrol is supplied. The extreme lift of the needle is controlled by the screw at the top of the carburetter. At starting the needle is raised by the lever on the left, which allows petrol to flow over the jet and mix with the air admitted through a series of holes. A butterfly throttle (not shown) is fitted also a Bowden extra air valve, if desired. With the addition of a hot air box around the air port good results are obtained from a 50% mixture of petrol and paraffin. It is stated that the carburetter will work equally well in any position.

## SINGLE v. TWIN.

"Ixion's" Opinions on the above Controversy.

IT is perfectly evident that the influx of big American twins, caused by the transference of our industry to munition work, has caused many riders to revise their opinions as to the merits of the single-cylinder engine. The opinions of many correspondents and of more than one of my colleagues might be summed up in this quotation from a letter just to hand, "The big twin scores easily on account of its superb manners." Of this the British manufacturer is, of course, perfectly aware. He realises as thoroughly as his most experienced customers that the 500 c.c. single in point of racket and vibration is comprehensively worsted by any first-class high-powered twin. But he also knows what few amateur owners recognise, that it is a very difficult job to construct a V twin of which the crankshaft and connecting rod bushes will last as well as those of the 500 c.c. single, and this especially applies to the big end bushes of the connecting rods. These bushes are the weak point of all motor cycle engines, the available area being strictly limited where internal flywheels are retained, and being generally restricted by the narrow belt or chain line practicable with a motor cycle frame.

### My Trials Experiences.

It so happens that, as a motor journalist, I frequently subjected motor cycle engines to very serious tests before the war. I normally accompanied both the big Six Days trials, and in this work I gave the engines I employed a worse gruelling than any competitor, in that I usually watched all the hill-climbs, and then maintained a highly illegal average speed to overhaul the trial before the next hill. Other journalists profess to do this, but in practice I have usually noticed that most of the scribes take the latter half of the day's run very easily, whereas I have usually "scrapped" the whole distance. I find that the engine bearings of the  $3\frac{1}{2}$  h.p. single require attention after six days of such work, and that the corresponding bearings of a V twin-cylinder will not last out the week unless, indeed, the engine is one of very high power, and is consequently never fully opened out. Some while ago I made a resolution never again to trust a V twin for such jobs. Manufacturers have acquired similar information; hence their apparently inexplicable devotion to the comparatively coarse and vibratory single-cylinder.

### The Dilemma.

We may find that the increase of knowledge which the last two years have brought will enable our manufacturers to give us V engines which will wear reasonably well, besides extending the durability factor of the single-cylinder. But the position when war broke out was that the bearings of the highly efficient single-cylinder did not wear satisfactorily, and that those

of the medium-powered V twin wore very unsatisfactorily indeed. It was not by accident, nor yet by reason of a special 1,000 c.c. demand that the Yankees plunged on the 7-9 h.p. engines; the earnest maker had to choose between a single-cylinder, which was coarse, reliable, durable, and cheap, or a high-powered twin, which was heavy, expensive, smooth-running, and tolerably durable. The English makers made one choice, the Yankee makers preferred the alternative. The medium-powered twin of 1914 was a failure as a compromise; it was run at high revolutions with a minimum of big end bearing area, and its durability factor was too low. It would be very interesting if some engineer would set out for us pictorially the comparative bearing areas of a  $3\frac{1}{2}$  h.p. single-cylinder, 4-5 h.p. V twin, and 7-9 h.p. V twin.

### Reaching a Decision.

I am not at all sure that either solution is really sound. Heaven forbid that we should produce nothing better mannered than the  $3\frac{1}{2}$  h.p. single, which I frankly find rather intolerable after a prolonged dose of horizontal twins, Scott twin two-strokes, and various V engines. Heaven forbid equally that every motor cyclist who wants a pleasant mount should be burdened with a machine scaling some 3 cwt., costing up towards £100, if its specification is luxurious and its workmanship good, and demanding that its cumbrous engine shall be taken out of the frame whenever carbon accumulates. The one solution is cowardly, the other is clumsy. These are early days to don the prophet's mantle, for we are only just realising that we must work for superb manners in association with a durability as yet never attained. But there are hints to be assimilated. How does the Scott compare with the older types in respect of engine durability? How does the  $3\frac{1}{2}$  h.p. horizontal twin compare in the same line?

### Credit where Credit is Due.

I did not start this controversy, and I assume no responsibility of a speculative kind. But I do assert that if my choice in future were to be limited to the British single or the Yankee 7-9 h.p. twin, I would bluntly remark "a plague o' both your houses," and give up motor cycling to-morrow. If the inventors of the world can offer me no better alternative I will seek pleasanter travel on a pushbicycle or a light car, according to my purse. I refuse, on the one hand, to be shaken and rattled by the one-lung slugger; I refuse, on the other hand, to consider £100 and 3 cwt. as essential to solo riding. But if I can get reasonable bearing durability, combined with the delicious running and comparatively low weight of such machines as  $2\frac{3}{4}$ - $3\frac{1}{2}$  h.p. horizontal twins or V multi cylinder two-strokes, I shall remain a motor cyclist; and my present impressions are that both these types are superior solutions to the two outstanding patterns—our own

## Single v. Twin.—

3½ h.p. single and the 7-9 h.p. Yank—which most disputants persist in regarding as the only combatants in the arena. The good old crusted Tory wing of our industry clings to the 1907 types, burnished up a little to suit the times. The mediocre copyist admires foreign institutions, and produces slightly variegated editions of the big Yankee twins. The extreme Radical wing comes out with disturbing novelties, such as those I have indicated. When the war ends there will be a general election. I shall be surprised if the old Tory, or the follower of the Stars and Stripes, command the bulk of our suffrages.

## Handling the Heavyweights.

As some of the correspondents on the heavyweight question have grumbled about the awkwardness of manipulating these machines when their engines are not working I print an ancient tip. Always manoeuvre them from the saddle. Do not seize them by the handle-bars and lead them about as you would a baby two-stroke. Immediately on entering the garage, seat yourself in the saddle, and paddle them about with your feet; all sense of effort is thus eliminated, for the balance is in this manner easily preserved, and they become as lamblike as Holroyd's ancient Moto-sacoche.

## AUTOMATIC CARBURETTERS.

## The Difficulty of Attaining Petrol Economy.

SEVERAL readers, some of whom are inventors or experimenters, evince great interest in the question of fuel economy with automatic carburetters. The writer has no wish to assert that the automatic types are inevitably more extravagant of petrol than the two-lever types, but it is his opinion that existing automatic patterns are mostly rather thirsty. There is every reason to hope that we shall eventually get better single-lever carburetters. One of our correspondents remarks quite accurately that the ideal automatic carburetter must give a perfect mixture for all the engine speeds and throttle openings, coupled with a slight temporary enrichment of the mixture under all accelerations. He adds with equal truth that many vaporisers are spoilt by one of two weaknesses. Either there is a weakness at a certain throttle opening, which compels the mixture to be unduly enriched over the whole range, or the petrol vapour and air are insufficiently mingled, weak zones of mixture are formed, and enrichment over the whole range is employed as a corrective. This particular reader is getting 90 m.p.g. from his own experimental automatic carburetter on a 650 c.c. sidecar outfit, and the figure indicates that he is working on very sound lines. In the past the evolution of motor cycle carburetters has

to some extent been hampered by an exaggerated demand for simplicity. The manufacturers have plumped for a carburetter which is cheap to buy, *i.e.*, one constructed of a few simple parts; a carburetter which is easy for its testers to set, *i.e.*, simple in its internal mechanism; and a carburetter which cannot easily be deranged by a tinkering duffer, *i.e.*, one with a plain single jet and choke tube. It is the writer's opinion that as soon as we get an alliance between a first-rate inventor and a scientific manufacturer, which will offer the trade a first-class automatic at the price now paid for comparatively crude semi-automatic, the situation will alter. At present inventors are hampered by the fact that assemblers are accustomed to pay a certain price for carburetters, and will not pay more, while this standard price does not offer the inventor a profit on a carburetter of complex construction. In other words, automaticity and fuel economy are not mutually exclusive in essence, and we may hope to get 100 m.p.g. single-lever carburetters for 3½ h.p. sidecar outfits and 5 h.p. solo machines before very long. The main trouble may be that they will be expensive to buy, and that the motor cycle manufacturers will be averse to standardising them.

ROAD RIDER.

## LIGHT ON PETROL LICENCES.

VARIOUS questions have been raised by correspondents in connection with the new petrol allowances, and we give below a few specimen questions and their answers for the benefit of readers in general:

**Question.**—I am not desirous of sending for a licence to cover a period of five months at the moment, as I may have to give up my business and join the Army in the course of the next six weeks or so. May I therefore postpone sending for the licence and still be sure of getting it?

**Answer.**—Yes. It is open for any motorist to apply for a licence at any future time. Probably, supposing that you apply in December, you will get a January-May licence; but this is not quite settled.

**Question.**—Supposing I send for my five months' allowance now, and in two or three months, say, join up: must I lose the money I pay on the licence?

**Answer.**—No. You can claim a refund for the unpurchased spirit at the end of the licence period.

**Question.**—We are told that we must apply for petrol licences after October 9th in cases where the licences expire at the end of this month. At the moment I have no motor vehicle, but I am on the look-out for a second-hand machine,

and if I purchase one shall then, of course, desire a licence. Is it important that I apply for the licence before the end of the month?

**Answer.**—See answer to Question 1. It is not compulsory for you to apply for the licence renewal before the end of this month.

## AN AIR-COOLING DEVICE FOR SPARKING PLUGS.

THE ingenious little air-cooling device which we illustrate consists of a ribbed terminal made of an alloy which has special radiating properties. Since the terminal is composed of a metal which is a good conductor of heat, and is screwed firmly down on to the upper end of the central electrode, it serves to conduct away the heat therefrom, and so is bound to be an advantage on any sparking plug. It is sold by Messrs. Gordon's Motor Works, Royston, Herts.

## SIDECAR OR CYCLE CAR?

A Comparison  
from the Point of View of a  
Family Man.

By FRANCIS E. COOKE.

A  $3\frac{1}{2}$  H.P. motor cycle and sidecar make on the whole a very satisfactory conveyance for a man and his wife, and at a pinch will accommodate a small child in addition. Indeed, for a couple of years or so I contrived to pack my wife and two children in a Canoelet sidecar, and my  $3\frac{1}{2}$  h.p. Premier pulled the load for hundreds of miles without failing us. But that was in Essex, where the country is for the most part flat, and weight does not tax an engine so much on level roads as one would think. I found it necessary, however, to maintain the machine in a high state of efficiency, cleaning the engine every six or seven hundred miles, which, during the summer, meant taking it down about once a month. After the novelty had worn off this constant cleaning became rather irksome, and I began to wish for a greater margin of power.

After a time what had been merely a desire became an urgent necessity, for the children had grown to such an extent that it was a physical impossibility to cram them into the Canoelet any longer. At the best it had always been a tight fit, and it had been necessary to stop every twenty miles or so in order that they might stretch their legs. Moreover, I was about to move into Surrey, and it was evident that more power would be required to carry four people up the Surrey hills than had sufficed on the flat roads of Essex. And so the fate of the  $3\frac{1}{2}$  h.p. machine was sealed, and I had to consider with what I would replace it.

A cycle car seemed the natural solution of the problem, and when I moved into my new house I had a garage put up that would accommodate a small car. I could not afford to pay much over £100 for a cycle car, and the selection available at that figure is not a large one. When I came to look into the matter I found to my dismay that the accommodation of such cycle cars as I looked at was quite inadequate for my purpose. In some cases there was not overmuch room for two, whilst in the widest there was only room for two adults and one child with a good deal of squeezing. This knocked the bottom out of the cycle car scheme, and I consequently found myself in something of a dilemma.

### More Power and Room.

I found the solution to the problem in the Premier Co.'s showroom in the shape of a very long tandem-seated sidecar. On measuring it up I found there

would be ample room for my young child to sit on a hassock between the two seats without unduly crowding the others. It had a fine strong-looking chassis with five-point connection and laminated springs. As the company agreed to make me a satisfactory allowance for my old combination I decided to buy this tandem-seater and mate it to one of the big 7-9 h.p. Premier twins with three-speed countershaft gear.

### Improving the Springing.

The sidecar at the outset was not an unqualified success, proving most uncomfortable, so much so, indeed, that my wife, when I took her for a short trial spin, begged me to let her walk home. There seemed to be no give in the springs at all, and, as I subsequently found from personal experience, it bumped one about like an unsprung farm cart. When I complained to the makers they replied that it was sprung for a load of twenty stone, and would be most uncomfortable with any less weight. As the total weight of the passengers I proposed to carry did not exceed fourteen stone, I set about rectifying the fault. Taking down the back springs I removed two leaves from each, and this modification, with the addition of a spring seat supplied by the makers, made the sidecar passably comfortable. When only one passenger is carried the load is made up with ballast in the form of a 56 lb. weight. This is enclosed in a wooden frame which fits exactly the toe of the sidecar so that it cannot shift about, the weight being borne by the front springs. When driving with an empty sidecar I find this weight is quite sufficient to prevent bouncing, and at the same time it helps to steady the combination. I have now a vehicle that will accommodate the whole family in comfort without undue crowding, and have still room to take another passenger on the carrier should I want to. No cycle car that I have seen would yield the same accommodation nor be likely to give such satisfactory results.

### Economy in Petrol and Tyres.

The power and speed of this big Premier twin are really astonishing. It will pull the four of us up practically any main road hill on top gear (5-1), and maintain a steady 30 to 35 m.p.h. all day long on give and take roads. Gradients such as that from West Clandon up to Newlands Corner; Bury Hill, on the Arundel Road; and Fish Hill, Broadway, the

## Sidecar or Cycle Car?—

machine simply plays with, and the only hill I have yet changed down to second on was the Wyche, near Malvern, and then only to round the hairpin.

I have no practical experience of cycle cars, but should say that my combination is a good deal more economical. The petrol consumption, carefully checked over some 1,700 miles, works out at sixty-four miles per gallon of No. 2 Pratt's, not taking into account what I have wasted and used for cleaning purposes. The tyres, extra heavy rubber-studded Dunlops, 650 x 65 mm. on back wheel and 2½ in. on front, seem to be wearing very well, and have not been cut or punctured. That on the driving wheel, I should say, will run another fifteen hundred miles, whilst that on the front wheel shows no appreciable signs of wear. The original tyre on the sidecar, a light Michelin, I scrapped after 1,000 miles, as it then punctured three times in quick succession. It was by no means worn out, but I do not care to use tyres that are not reliable, and it was not strong enough for the work to which it was put. To put a light sixteen shilling tyre on a sidecar sprung to carry 20 stone and costing nearly £20 strikes one as being unwise, and it speaks well for Michelin tyres that this one yielded such good results as it did.

The machine has chain-cum-belt drive, and the 1½ in. Dunlop belt shows no signs of wear at all and has only been shortened once, and, thanks to the large

pulley, never slips. The three-speed countershaft gear is most efficient, and can be changed as easily as a hub gear without declutching. The gear box has a large filler cap, and can be lubricated very expeditiously with the aid of a small funnel. The clutch, composed of exceptionally large plates, is mounted on the pulley and very accessible. It is, moreover, extremely sweet in action, rendering the machine delightful to handle in traffic.

Although the three Premier motor cycles I had previously owned had given every satisfaction and afforded me no end of enjoyment, I do not think I knew what real comfort on a motor cycle was until I bought this big twin. Thanks to the great weight which enables the machine to hold the road, the even torque of the twin engine, sprung footboards, the large tyres, and a Brooks B170 saddle, it is the acme of comfort, and bad roads that used almost to shake me to pieces on a 3½ h.p. are now hardly noticeable. And what is more, it is the most tractable machine in traffic that I have ever driven.

There must be many motor cyclists who, like myself, do not care to leave their children at home in the charge of a maid, and yet it is something of a problem how to carry them. I would strongly advise anyone in that position to try a big twin and two-seater sidecar, as I am sure it is a sounder proposition than a cycle car, being more economical and, I should say, more efficient.

## A Colonial Built Engine.

F. D. Johnston, of Perth, W.A., and his machine, the engine of which he built himself.

**W**E recently had a visit from Mr. F. D. Johnston, formerly foreman at the garage of Messrs. Gettys, Ltd., West Perth, Western Australia. Mr. Johnston, who is at present engaged in an important munitions factory "somewhere in England," shortly before leaving Western Australia completed the first motor cycle engine ever built in that State of the Commonwealth.

The engine, it will be seen, is fitted with large overhead valves; has the usual aluminium crank case, while cast iron is used for the cylinder, piston, detachable

head, and flywheel. The capacity of the engine is 350 c.c., giving a horse-power of 2¾. The crankshaft and connecting rod are turned from solid bar nickel steel, and run in phosphor-bronze bearings. In the piston there are two rings, while the piston is drilled to assist lubrication. The cams are made detachable, and are screwed and pinned to the timing wheels, thus allowing a range of cams to be used for various types of work. The magneto is driven by a sprocket and chain. From the photographs the engine appears to be particularly well made.

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

### Finding the Cubic Capacity.

**?** (a.) Is it possible to calculate the cubic capacity of an engine from the bore and stroke? (b.) If not, what other data would be required, and what would be the method?—J.K.K.

(a.) It is quite possible to calculate the cubical capacity of an engine from the bore and stroke. (b.) The formula is as follows:  $D^2 \times .7854 \times S \times N$ . D, diameter of cylinder; S, stroke; N, number of cylinders.

### Heating the Inlet Pipe.

**?** Would you kindly tell me the best way of heating the inlet pipe on a G.P. Morgan? The inlet pipe is long, and in consequence becomes very cold and frosted. I have trouble with the engine stopping when running slowly, and I would be glad to know if you think heating the inlet would cure the trouble.—S.I.F.

The trouble appears to be mainly a badly adjusted carburetter. Evidently too much air is admitted at slow speeds. If you take the air in warm, we think you will find a general improvement all round. The inlet pipe can be enclosed in a jacket through which water heated by the engine can pass on its way to the radiator, or a tube can be brought from one of the exhaust pipes to a jacket surrounding the pipe, as on the flat twin Humber described in our last issue.

### A Question of Alignment.

**?** While left on the stand in the street my motor cycle has twice been knocked over, and each time it has fallen on the same side. After the second fall I found a great tendency to wobble, and on greasy roads the back wheel lurches badly. I presume the frame has been bent slightly, causing the two wheels to be out of track. I may say the wobble is worse on slack tyres than on hard tyres. (1.) How can I test the wheels for being out of alignment? (2.) How can I get a true alignment without having the frame straightened?—J.F.H.

(1.) On a level wood, stone, or cement floor wheel your machine first through a pool of water and then on to a dry part of the floor, taking care to see that the front wheel is pointed dead straight ahead. If the tracks of the wheels absolutely coincide you will then know that the machine is in alignment. (2.) You must have the frame straightened, and this must be done by an expert repairer, otherwise you will never get the wheels into line.

### Irregular Firing at Slow Speeds.

**?** I should be very much obliged if you will inform me what is the cause and the remedy of the following: (1.) I have a 1915 7 h.p. twin, which runs all right with the throttle half open, but when I close it down it seems there is only one cylinder firing. (2.) If I raise the exhaust lever, the one cylinder will keep on firing until all the fuel in the carburetter is used up.—E.H.J.

(1.) There is evidently an air leak between the carburetter and the faulty cylinder; this may be difficult to find, but it must be stopped. (2.) Adjust your exhaust lever so that it operates equally on both valves. Apparently it does not raise one of them.

### IMPORTANT NOTICE.

#### GOODS MADE IN GERMANY.

The proprietors of this journal, being fully in accord with the recommendations agreed upon at the Paris Economic Conference, give notice that they will not permit the advertisements of new goods manufactured in enemy countries to appear in this publication, either during or after the war.

ILIFFE & SONS LTD

### Timing.

**?** My machine is a 1913  $3\frac{1}{2}$  h.p. three-speed single-cylinder. (1.) How should the engine be timed, both as regards valves and magneto, for speed? (2.) Why does advancing the magneto lever cause the engine to increase in speed? (3.) Can a magneto be timed "advanced" for speed and retarded for "non-speed," apart from what one can alter by means of the little advance and retard lever?—R.L.H.

(1.) The engine should be timed in the following manner: Valves: Set the exhaust valve to close just after the completion of the exhaust stroke. It will then commence to open when the piston is about one-seventh of the length of the stroke from the bottom of the firing stroke. The inlet should commence to open as the exhaust closes, and remain open for one complete stroke of the piston or a little more, that is, while the flywheels turn through  $180^\circ$  to  $200^\circ$ . Magneto: Place the piston exactly on top of the compression stroke, and connect up the magneto with the points just about to break and the ignition lever two-thirds to fully retarded. (2.) Because it causes the spark to take place earlier

in the stroke, and consequently when the compression is at its highest point, and the explosion is then more powerful. (3.) Certainly, this is the best method to adopt.

### Carburetter Choking.

**?** I shall be greatly obliged if you will kindly answer the following queries with regard to my 1913 7.9 h.p. rear sprung Indian.

(1.) It has a coachbuilt sidecar fitted (three-point suspension). Can you suggest a scheme for altering it to four or five-point suspension, to obviate the present whip of the sidecar due to spring movements? (2.) On opening out on hills or on the level choking occurs, the engine splutters, and the power dies away. The extra air has to be closed part of the way up hill, when immediate increase of power is noticeable, which, however, dies away rapidly. No overheating is noticeable. The valves and timing are apparently in order (although hints as to the exact setting would be acceptable). Is this likely to be due to the apparent heaviness of the petrol now obtainable, as petrol now appears to smell badly of paraffin, and does not evaporate quickly? Will the weighting of the float improve matters? I have also noticed stoppages on hills, as lately described in your pages, and have been unable to discover the cause. (3.) I have recorded 70-72 m.p.g. over a considerable mileage, but this was until about two months ago, and the consumption has apparently deteriorated with the quality of the fuel.—E.T.

(1.) If the machine is fitted with an Indian sidecar you can get the necessary fittings to equip it with four-point suspension by writing to the Hendee Manufacturing Co., Ltd., 366-368, Euston Road, London, N.W. (2.) As regards the valve setting. If you set the exhaust to close on the top of the stroke, since a double cam is fitted the inlet opening will be simultaneously made correct. There should be  $\frac{7}{16}$  in. advance on the ignition. The trouble of which you complain is possibly due to the level of the petrol being incorrect. The petrol should come to within  $\frac{1}{16}$  in. of the top of the jet; the level may be reduced by bending down the arms on which the float is suspended. (3.) Seventy miles to the gallon is quite good, but if you get an increase in the consumption it is possibly due to periodic flooding of the needle valve, which may be caused by impurities in the petrol. The needle valve need not be ground in, but should be merely tapped occasionally, and sometimes turned round on its seating, when the grit will be displaced.

**The Lighting of Sidecars.**

I should be glad if you would inform me whether it is obligatory for me to have a lamp on my sidecar. At present I have only a standard head lamp and tail lamp on my machine, and I do not wish to go to the expense of a lamp and generator if it is not compulsory.—J.E.B.

Yes; you must have a lamp on your sidecar showing the full width of the vehicle, but a powerful light is unnecessary. In some districts a light is not compulsory, but it is always desirable.

**Starting with a Single Gear.**

(1.) What would cause knocking in an engine on a single-gear machine when starting with the clutch? (2.) Can the effects of knocking be seen, and what is knocking? (3.) How are the valve guides removed on a 1911 Triumph? (4.) What is the best method to remove and replace the piston rings?—F.W.

(1.) The absence of a two-speed gear. This means that you must start on a gear high enough for ordinary purposes, and unless you let the clutch in very, very gently, and retard the spark sufficiently, and also have a clean engine, knocking is quite possible. (2.) The ultimate effects of knocking are badly worn bearings. The cause of knocking, also called konking, has never been properly explained, but it is thought by some to be side rock of the piston against the cylinder walls, caused by the explosion occurring before the piston reaches the top of the stroke. (3.) These are screwed into the cylinder casting. (4.) The best plan is to use an expanding tool, which is like a pair of pliers reversed. You insert the ends in the slot in the piston ring, and gently force them apart. When there is a gap you slip a thin piece of tin between the piston and ring, and gradually work it round. When it is free, then equally space three similar pieces of tin round the piston and lift the ring off. The difficulty is to remove these rings without breaking them, especially if they are carbonised badly.

**Cleaning by the Oxygen Process.**

I should be very much obliged if you would give me any information as to how cylinders can be decarbonised by the oxygen process. I believe this is quite possible for an amateur to do, and I should be glad if you would give me a short account of the operation.—E.M.F.

The process is one which an amateur can carry out quite well; but, of course, it is expensive, as considerable outlay is required for the cylinder of oxygen. A special burner or torch is used, and also a reducing valve so that the supply can be comfortably controlled. A lighted gas jet is first inserted, or even a wax taper, into the cylinder head, after the valve caps have been removed, the piston placed on the top of the stroke, and the carburettor emptied. On the oxygen being turned on to play upon the cylinder head the carbon will catch fire and be rapidly burnt, and will continue burning until no carbon is left. Care must be taken to move the flame about so as to clean the whole cylinder.

**Refusal to take Air.**

Will you be good enough to inform me regarding my 2½ h.p. Sun-Villiers? It suddenly started one evening to misfire and back-fire, and has lost all power and will not take any air without continuing to blow back all along the road, and only ceases when I close down the air. I have, since this started, taken the engine down and thoroughly cleaned all carbon deposit out. I have also thoroughly cleaned out the carburettor, but I did not fit new piston rings, as I thought the compression was still good; the magneto seems O.K., and gives a good spark. I have just fitted a new Lodge two-stroke plug, but I cannot put things right. I do not think the release valve leaks, as I tested this.—B.S.

We take it that you mean popping in the carburettor not back-firing. Popping and blowing back through the carburettor is practically invariably an indication of too weak a mixture. This may be due to a choked jet, caused by either water in the petrol, which may be difficult to

trace, owing to its being transparent, or to foreign matter in the jet or carburettor passages. Air leaks between the carburettor and engine are also likely causes, or an air leak in any portion of the crank case, owing to faulty cylinder joint. You might check the magneto timing. The spark should occur when the piston is on top dead centre, while the ignition is fully retarded.

**The Tax on Petrol.**

I ride a 1916 Rover and sidecar. I recently received my licence to buy petrol. Now this licence costs me 6d. per gallon for an allowance of six gallons of petrol per three months. Now petrol costs me 2s. 9d. per gallon, so that with the 6d. per gallon re tax I am paying really 3s. 3d. per gallon. In a recent issue of *The Motor Cycle* I noticed a letter by Lt. Hyndman, R.G.A., re prices of substitutes. He says the 6d. per gallon tax is included in the 2s. 9d. per gallon, so that I am being done out of 6d. every time I purchase a gallon.—H.B.

Lt. Hyndman is quite right, but you are not being defrauded, for there is, and has been for some time, a tax of 6d. per gallon on petrol, which is included in the price. The 6d. per gallon paid to the Petrol Committee is an extra war tax, making a total tax of 1s. per gallon. It is not proposed to continue the war tax after the termination of the war.

**RECOMMENDED ROUTES.**

**GLOUCESTER TO EASTBOURNE.**—L.R.C.S. Gloucester, Cirencester, Cricklade, Stratton, Aldbourn, Hungerford, Newbury, Basingstoke, Odiham, Farnham, Elstead, Milford, Highdown Ball, Horsesham, Cowfold, Hurstpierpoint, Ditchling, Lewes, Polegate, Eastbourne.

**KING'S LYNN TO DUDLEY.**—R.W.T.

King's Lynn, Wisbech, Guyhirne, Thorney, Peterborough, Oundle, Market Harborough, Husbands Bosworth, Lutterworth, High Cross, Smockington, Coventry, Birmingham, Dudley. Approximately 120 miles.

**BRISTOL TO BEDFORD.**—W.J.M.

Bristol, Downend, Acton Thrville, Malmesbury, Cricklade, Faringdon, Oxford, Bicester, Buckingham, Stony Stratford, Newport Pagnell, Bedford.

**BARRY TO EXMOUTH.**—T.A.W.

Barry, Cardiff, Newport, Severn Tunnel Junction, train to Pilning, Bristol, Bridgwater, Taunton, Cullompton, Exeter, Exmouth. If you wish to avoid the tunnel (no petrol is supplied there now), you can go to Newnham and cross by ferry, or to Gloucester and do the whole trip by road.

**ABERDEEN TO BARNSELY.**—W.S.

Aberdeen, Stonehaven, Laurencekirk, Brechin, Forfar, Glamis, Coupar Angus, Perth, Kinross, Cowdenbeath, Burntisland, ferry to Granton, Edinburgh, Dalkeith, Lauder, Coldstream, Wooler, Morpeth, Newcastle, Neville's Cross, Ferryhill, Darlington, Scotch Corner, Leeming, Boroughbridge, Wetherby, Aberford, Ferrybridge, Pontefract, Barnsley.

Blackberry pickers taking lunch at Hinton Roughs (Worcestershire), a spot where both blackberries and sloes are prolific. The motor cycles are an Ariel and A.J.S.

## New Imperial "Light Tourist"

Send for Catalogue and Booklet  
"Don't take Risks—and Why!"

Read the following, which speaks for itself.

Sheffield, 22nd June, 1916.

"I have been riding on one of your 2½ h.p. New Imperial 'Light Tourists' for nearly 12 months and I must say it is a 'Grand-un.' I have done **OVER 9,000 MILES** on the machine, travelling in connection with my business, with **not the slightest bit of trouble**. The condition of some of the roads about here is simply awful, but the strength of the frame withstands all bumps in great pot holes and I weigh 10½ stone. Only last week some well-known motor cyclists here were discussing the merits of different machines, and one made the remark that your 'humble' had the **best lightweight in the town**, and I have. I am more than satisfied in every detail."

L. E. WILKINSON.

— Established 1887. —

NEW IMPERIAL CYCLES, LTD., BIRMINGHAM

# THE "GRADO" VAPORIZER

(PROV. PATENT No. 13113)

**HAS SOLVED THE PETROL TROUBLE. IT MAKES  
PARAFFIN EQUAL TO PETROL.**

This is why: The Paraffin is twice heated before entering the engine—once in liquid form, and again after it has left the carburetter jet.

What, then, the "GRADO" VAPORIZER guarantees, is a superheated mixture, perfect combustion, high power, and clean engine.

It is very light and strong, and can be easily taken to pieces.

The Price of the attachment is **£2 - 15**, and it will save its cost in a month.

Write for full particulars showing internal construction. Manufactured only by

**The Grado Manufacturing Co.,  
Presto Buildings, Pershore Street,  
BIRMINGHAM.**

# MISCELLANEOUS ADVERTISEMENTS.

## PRICES.

**ADVERTISEMENTS** in these columns—First 12 words or less 1/6, and 3d. for every two words after. Each paragraph is charged separately. Name and address must be counted. Series discounts and special terms to regular trade advertisers will be quoted on application. Postal Orders sent in payment for advertisements should be made payable to **LIFFE & SONS Ltd., and crossed** & Co.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor St., E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

## NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charge. Only the number will appear in the advertisement. All replies should be addressed, "No. 000, c/o 'The Motor Cycle,' 20, Tudor Street, E.C."

## DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged, when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Liffe & Sons Limited. At the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

## SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

## MOTOR CYCLES FOR SALE.

### A.J.S.

1916 A.J.S. Combination, latest 4 h.p., brand new, with spare wheel, tyre, and wind screen; in stock for immediate delivery.—Prices and particulars, Robinson's Garage, Green St., Cambridge. [3368]

1916 4 h.p. A.J.S. Combination, 800 miles, electric light (Lucas), spare wheel, hood, every possible refinement, better than new; an absolute bargain, £90, no offers.—Smith, Richmond Cottage, Wistaston Green, Nantwich. [X9611]

1916 4 h.p. A.J.S., latest model, specification as list, with Lucas horn, ridden about 500 miles, soiled only, genuinely and really indistinguishable from new, condition guaranteed; £70.—Robinson's Garage, Green St., Cambridge. [3369]

### Alldays.

ALLON, 1916, like new, perfect; £27; part exchange.—18, Gowllett Rd., Peckham. [3357]

COLMORE Depot, 31, Colmore Row, Birmingham, can supply immediately all models of Alldays Allon. [0796]

ALLDAYS 2-stroke, only run few miles; great sacrifice, £20.—Thorpe, Whitehorse Rd., Thornton Heath. [3407]

ALLDAYS Matchless, 3 1/2 h.p., 2-speed, enamelling and plating excellent; £35.—Parker and Son, St. Ives, Hunts. [3437]

PETROL Free with 1915 Alldays Matchless, 4 h.p., clutch, kick start; 26 gas.—Troward, 78, High St., Hampstead. [3204]

1915 Allon, 2-stroke, 2-speed, good condition; must sell; first reasonable offer.—Baker, 146, Heaton Moor Rd., Stockport. [X9586]

ALLON, 2 1/2 h.p., almost new, 2-speed, clutch, lamps; cost £50, nearest £39.—40, Summerfield Crescent, Edgbaston, Birmingham. [X9614]

ALLDAYS 2-stroke, forced feed lubrication, all complete, practically 1916 engine; £18, bargain.—Grey, 37, Whitehall Rd., Smethwick. [X9617]

ALLON, 1915 1/2, 2 1/2 h.p., 2 speeds, 2-stroke, not done 2,500 miles, all accessories, splendid condition; £30.—Webb, 5, Globe Rd., Dagenham, Essex. [X9509]

### Antoine.

PETROL Free with 1911-12 Antoine 6 h.p. (win, clutch, kick start, new tyres, belt; 14 gas.—Troward, 78, High St., Hampstead. [3198]

### Ariel.

ARIEL, 1913, 7 h.p., chain drive, countershaft gear, sidecar, and accessories; £42/10.—Collier, Deal St., Halifax. [3487]

COLMORE Depot, 31, Colmore Row, Birmingham, have in stock for immediate delivery all models of Ariel motor cycles, with or without sidecars. [0797]

### A.S.L.

A.S.L., 3 1/2 h.p., spring frame, footboards, etc.; £22/10.—Colmore Depot, 31, Colmore Row, Birmingham. [X9373]

### Auto-Wheels.

AUTO-WHEEL of Luxe and Enfield Cycle, special built; £12.—97, Letchmere Rd., Battersen. [3327]

AUTO-WHEELS of Luxe, two, 1916, 4 months old, £12 each, or nearest offers.—Arnold, Candie Rd., Guernsey. [X9416]

GENUINE Wall Auto-Wheel, not used since overhauled and tested by makers; £7.—Geer, Gas Works, Goring, Oxon. [3318]

B.S.A. Auto-Wheel, in good condition, 1914; £10, or will exchange in part payment for 2 1/2 h.p. light weight.—Phillips, Motories, Glyn, Chirk. [X9312]

THREE Genuine Wall Auto-wheels, 1914 models, little used; £7/10, £8/10, and £9/10.—Murray's, 37a, Charles St., Hatton Garden, Holborn. [X9517]

## SURRIDGE'S PATENTS.

COMBINED HEAD AND REAR  
LAMP CONNECTORS  
with Gas Bag ensures a steady  
light to both lamps.

Price 4/- Each.

Without the Gas Bag, 2/6 each.  
Length overall 70 inches.

GAS BAG LAMP  
CONNECTORS FOR  
HEAD LAMP ONLY

A Perfect Steady Flame  
at all times.

6", 1/-; 9", 1/2; 12", 1/4;  
15", 1/6; 18", 1/8; 24", 2/-  
each.

The Repair Outfit you should use.

2/6 Each.

**HOLDTITE PATCHES and OUTFITS**  
have been supplied to H.M. Government  
in their thousands and are still demanded

Surely this should prove that the  
HOLDTITE is the BEST under all  
conditions. Send for the new list.

If your Agent wants to put you off  
with any other Patches, REFUSE and  
DEMAND THE BEST that has stood the  
SEVEREST TEST AT THE FRONT.

YOUR AGENT can supply, and it is up to  
him to stock HOLDTITE PATCHES etc.

Write me direct if unable, and kindly  
give name of your agent.

58, LOMOND GROVE,  
CAMBERWELL, LONDON.

## MOTOR CYCLES FOR SALE.

## M.A.G.

**PETROL** Free with 1913 M.A.G. 3½h.p. twin, De  
Lissa valves, Enfield gear; 25 gns.—Troward, 78,  
High St., Hampstead. [3203]

## Matchless.

**1913 3½h.p. Twin Matchless**, 3 speeds, lamps, horn,  
etc.; £32.—Simister, Jordangate, Macclesfield. [X9174]

**MATCHLESS J.A.P.**, 6h.p., fine engine, in good  
order; £45.—Grandex Motors, 349, Euston Rd.,  
London. [3238]

**MATCHLESS**, 1913, 8h.p., 2-speed, coachbuilt S.C.,  
good condition; trial given; nearest £35.—J. Bull,  
423, East India Dock Rd., Poplar, E. [X9170]

**1915 Matchless**, 7-9h.p., all chain drive, 3-speed gear,  
and 2-seater sidcar.—Julians, 84, Broad St.,  
Reading. Biggest motor cycle dealer in the South. [0853]

**MATCHLESS** Combination, 1915, 3 speeds, M.A.G.  
engine, mileage under 5,000, under condition, many  
extras; £75 cash.—Tarry, 102, High St., Boreley,  
Kent. [3428]

**1915 8h.p. Matchless-Jap** Combination, 3 speeds, ex-  
cellent condition, new tyres, Lucas lamps, speed-  
ometer; £78.—Paymaster Morris, Blandford Camp,  
Dorset. [X9399]

## Minerva.

**MINERVA**, 4-5h.p. twin, Rothardt mag., Mabon  
clutch, good tyres, low frame; £12.—Massey,  
Rounton Rd., Weltham Abbey. [X9480]

**MINERVA**, 3½h.p., Bosch, B. and B., new Dunlop  
belt, recently re-bushed, 45 m.p.h., trial, £12;  
also Minerva carburettor, 5/-; Bowden controls, 5/-;  
Jessop, Kilton, Boston, Lincs. [X9405]

**MINERVA**, 3½h.p., m.o.i.v., B.B. carburettor, new  
Druids, 26x2½ wheels, good covers and belt, ad-  
justable pulley, in good condition throughout; £6/10  
cash.—Pudney, Welton-on-Naze, Essex. [X9403]

**MOTOR** Cycle, twin Minerva, 4½h.p., Bosch, new  
frame, belt, tyres, spring forks, good running  
order; any trial; £16/10, with sidcar; called up.—  
Estate Office, 94, Heath Rd., Twickenham. [3465]

## Moto-Reve.

**MOTO-REVE**, 2h.p., single-cyl., mag., ready drive  
away; £9.—Buthin, Bangalow, Galleymood, Chelms-  
ford. [3248]

## Motosacoché.

**MOTOSACOCHE**, 3½h.p. twin, 2-speed gear, all  
chain drive, footboards.—Colmore Depot, 31, Col-  
more Row, Birmingham. [X9380]

**MOTOSACOCHE**, 2½h.p., Bosch, Druid forks, sound  
tyres, tubes, engine perfect; bargain, £14, or near  
offer.—W., 79, St. Stephen's Rd., Hounslow. [3251]

## New Hudson.

**1916 2½h.p. New Hudson**, 2-stroke, model C, new;  
accept £30.—Thos. Booth, Frodsham. [3221]

£38, or offer.—1913 3½h.p. 3-speed New Hudson and  
coach sidcar, accessories, done 1,400.—Mrs. Arthur,  
Bracklenae, Claygate, Surrey. [3347]

**NEW** Hudson, model C, 2-stroke; £38; delivery from  
stock.—Exeter Motor Cycle Co., Ltd., Bath Rd.,  
Exeter, and Tavistock Rd., Plymouth. [0840]

**NEW** Hudson, 2½h.p. J.A.P. engine, 3-speed, clutch,  
Armstrong gears, in perfect condition; £24.—  
Mitchellmore, 13, Poplars Av., Willesden Green. [X9511]

**1913-1914 3½h.p. 3-speed** New Hudson, complete  
with lamps, horn, etc., not run 1,000 miles, as  
new; £40.—Simister, Jordangate, Macclesfield. [X9172]

**NEW** Hudson Big Six Combination, C.B., counter-  
shaft, clutch, 3-speed, speedometer, lamps, etc.;  
trial arranged; perfect condition.—17, High St., Wir-  
chester. [X9659]

**NEW** Hudson, model C, £38; New Hudson, model  
C, slightly soiled, £35; New Hudson model 6B  
combination, £78/15; all in stock.—Marston, 26 and  
31, Bridge St., Chester. [X9596]

**NEW** Hudson 1914½ Big Six Combination, 3 speeds  
and kick starter, all accessories, very smart and  
powerful; bought car; £52/10; good condition.—J.  
Yates, 683, Leytonstone Rd., Essex. [3320]

**1915 2½h.p. New Hudson** 2-stroke Lightweight,  
countershaft 2-speed gear, Dunlop rubber studded  
tyres, accessories, in perfect condition throughout; £29.  
—The Premier Motor Co., Aston Rd., Birmingham. [3341]

## New Imperial.

**NEW** Imperial, latest 2½h.p. and 6h.p. models in  
stock.—Crow Bros., Guildford. [3427]

**NEW** Imperial, 1917, new, 2½h.p., 2-speed model;  
£38.—Motor Exchange, Horton St., Halifax. [3495]

**COLMORE** Depots, Manchester and Leicester, for im-  
mediate delivery of New Imperial motor cycles. [0805]

**1915 New Imperial-Jap**, go anywhere, perfect condi-  
tion; £25.—Stobbs, Grocers, Walsingham, Co.  
Durham. [X9816]

**NEW** Imperial 1916 Current Models in stock, also  
one or two bargains, shop-soiled.—Laytons' Garage,  
Bicester, Oxon. [X9643]

**1915 New Imperial-Jap**, 2-speed, new condition; price  
£27/10.—Sanders' Motor Cycle Depot, Bridge  
St., Hitchin, Herts. [X9389]

## The Danger of Cattle at Night.

**A**N Order demanding lights to be carried by persons in charge of cattle on the road at night has been issued at last, but it has taken years of propaganda to bring about such a desirable state of affairs.

It is eight years ago since the Coventry Motor Club obtained over 5,000 signatures to a petition to the Warwickshire County Council, urging them to adopt such a byelaw. When the petition was presented there was great hilarity among the farmer members of the Council, yet all over the country one reads of accidents which have occurred owing to cattle being driven on the road at night without any warning light. In some cases accidents have proved fatal, and we have still in our mind two cases of motor cyclists colliding with horses on the road at night with serious results. At various times this question has been taken up by different bodies, but all, particularly those who were earliest to recognise the desirability of such a byelaw, were laughed to scorn for their pains. The danger is surely obvious. As a matter of fact, a still more glaring instance of Government laxity is to permit tree trunks to be transported on the road at night with a large portion of the trunk projecting rearwards, and without a light to show the danger. It is only comparatively lately that certain counties put a stop to such a practice, not before there had been fatal accidents due to collisions. The Order, under the Defence of the Realm Act, has been made, no doubt, as a result of reduced lighting generally, but it should never be allowed to lapse in the public interest. In the case of a herd or drove of cattle the Order stipulates that there must be two persons in charge, each carrying a light. We notice that a white light is mentioned. In the past we have urged that a distinctive light, such as a blue or green light, should be shown, so that motorists would know what to expect, and accordingly be on the alert. There may be a difficulty at present in obtaining coloured lights,

but we imagine that white lights swinging all over the road are bound to cause confusion. However, one can rejoice that at last the authorities have deemed it desirable to protect the life and limb of road users by introducing such an obviously fair ruling. At the risk of repetition we reiterate that it is slow-moving objects that particularly need warning lights, especially in the rear. Up to the last year or so the reverse view seems to have been taken, for until lately it has been imperative that fast-moving vehicles only should exhibit distinctive rear lights.

## Position of Shock Absorbers.

**T**HE other day we overheard a conversation among a group of motor cycle engineers as to the relative merits of a transmission shock absorber placed (1) on the engine shaft, or (2) in the rear wheel. Advocates of the engine shaft position used as their argument that engine snatch should be nipped in the bud, i.e., on the engine shaft itself, and so ease the strain on the gear box and transmission, and further urged that to spread the transmission units over three distinct parts of the machine was bad, and, *inter alia*, meant a "loose" sprocket or belt pulley on the back wheel if the latter position were chosen. Such criticisms seemed sound enough, but the other side scored equal points by asserting (a) that a slipping medium on the engine shaft had to be adjusted so delicately to be really efficient at slow speeds that it refused to drive at high speeds; (b) there was no more snatch noticeable in the transmission when the shock absorber was placed at the rear than when it was in front; and (c) that when placed in the rear wheel it performed the dual purpose of damping out road shocks.

After all, practice constantly upsets theory, but the pros and cons are not without interest now that the question of improving the comfort of single-cylinder machines is in the air.

## A V-TYPE TWO-STROKE.

The Latest Production of the Vitesse Co.

WE are enabled to give our readers a description of a remarkable design of two-stroke twin-cylinder engine, which is at present in its experimental stages, but bids fair to be a complete success. Such an engine has often been referred to by correspondents, and several attempts to satisfy the demand for such an engine have already been made.

The Valveless Two-stroke Engine Co., of 303, Broad Street, Birmingham, are the makers of engine units for light-weights, notably those incorporated in the Sun-Vitesse models and other makes, and it is to be expected that their experience with this type of engine will greatly influence the latest development.

The cylinders of this V type twin are set at 60°, with crank throws at 120° to give even firing. Each cylinder is practically identical with the ordinary V.T.S. 2½ h.p. two-stroke engine, 70 × 70 mm., giving a capacity of 538 c.c., or approximately 5½ h.p.

### Staggered Cylinders.

The cylinders are staggered, being about 1½ in. out of line, set with transfer

Rear cylinder and crank case of the new V.T.S. twin two-stroke

Special design of crankshaft showing bob weights.

ports inside the angle, and the exhaust ports at front and back. The inlet ports are arranged on the sides and connected

by a specially-shaped induction pipe. The usual V.T.S. type pistons have been adopted, as also the design of small ends to the connecting rods. It is in the crank case that the principal variations from the usual designs occur.

The crank case is made of aluminium in three pieces, which bolt together to form two separate chambers, with a particularly ingenious form of gland between them; but for the present we are not permitted to describe this part of the engine.

### Adjustable Roller Bearings.

The crankshaft is an excellent piece of work, running in Timken taper roller bearings capable of adjustment. The big ends are quite an unusual feature. As will be seen from our illustration they are of

large diameter, but of narrow section, with plates riveted on either side, the bearing being taken on Timken parallel roller bearings. The whole engine forms a very successful combination of two single engines, in which the compact, and at the same time simple, method of constructing the double crank case is the most notable feature. The separation of the cylinders effectively eliminates the principal trouble in twin two-strokes, namely, unequal overheating and consequent distortion of cylinders. Lubrica-

Section of flywheel end of shaft, showing main roller bearing.

tion is effected in exactly the same way as in the single engine. An outside flywheel is fitted, with driving cog on the inner side. The inlet pipe is not decided upon yet, but it will probably take the form of a two-arm tube casting, with a third arm for attaching the carburetter. The exhaust pipe and silencers will be of orthodox type. So far the engine is at a purely experimental stage, and as to its behaviour when running on the road we are unable to speak, but its development will be followed with great interest.

## Another Spring Frame.

Another system of rear frame springing.

A VERY simple type of rear spring frame has been patented by C. W. Pidcock, of Hampstead. The accompanying sketches make the action of the device perfectly clear, but it seems to us to have an unnecessarily large number of hinged parts, all of which would be subject to wear, and when worn would cause rattling. The rear triangle of the frame is hinged at the bottom bracket and at the axle, the rear stays being supported below the saddle by a bell crank, to which a spring or springs can be attached in a variety of ways, two of which we show. Patent No. 15,332, 1915.

The Pidcock spring frame, showing the hinges.

### Flat Twins on the Bummel

Before I plunge again into the vortex of controversy let me fortify my natural modesty by a small chortle over the conversion of the Humber and Indian companies to the flat twin. They may induce readers to regard my irresponsible vapourings more seriously. I see Mr. Huskinson invites me to take away the gear box from the flat twin, and I shall find it as dead as mutton. He might as well challenge me to box him with my right hand strapped behind me. The flat twin may be, probably is, a trifle less dogged uphill on a high gear than a vertical single would be on the same ratio, though no  $2\frac{3}{4}$  h.p. single ever made can beat the flat twin 350 c.c. Douglas under these conditions, which suggests that the bigger flat twins are not quite as well designed as the original pioneer of their type. But the flat twin gets its own back, and more, in acceleration. I won't try to rob Mr. Huskinson of his gear box. But let a  $3\frac{1}{2}$  h.p. single and a  $3\frac{1}{2}$  h.p. flat twin, with similar gear ratios, round a corner together and discover a fierce hill. Both will have to change gear; but the flat twin will steal yards from the single. As hinted above, I doubt whether it is true that the flat twin is necessarily and eternally an inferior hill-climber on high gears, though some recent examples are guilty under this head. If it is true, it is equally true that all engines have to be revved pretty hard on occasions; that the average vertical single is the last word in discomfort when it is turning over at a really fast pace. Noise, unlike vibration, is a question of taste; some like noise, others hate it; some adore one sort of noise, and detest another sort; Mr. Huskinson thrills to the thwack-thwack-thwack of a well-tuned single on the tug; give me the b-r-r-r of a flat twin on the bummel.

### What about Wear?

Mr. Huskinson next tries to push me into deep waters. Have I ever tried a flat twin after 6,000 miles, when a myriad little demons of wear have developed illegitimate clearances in bearings and sprocket teeth and chain rollers and such like. The racket, he opines, is absolutely appalling. I shrewdly suspect he is writing from a brief trip on a solitary machine which has been cruelly man-handled in its younger days, for I do not rush into print without a few comparative experiences behind me, and my fortune has been the exact opposite of his. After 6,000 miles of hard work my chain-driven singles and V twins have certainly sounded like a drunken binder on cobble stones; and if a hard-worked flat twin can do with a little attention after an equal spell, it is not so badly worn, and the increase in noise is distinctly less marked. If one compared a  $3\frac{1}{2}$  h.p. single driven by a timid and elderly gentleman in the Fens with a flat twin man-handled by a somewhat carousy nut, his conclusion might almost hold good. But on a fair basis, the boot should be on the other leg. Revolutions, as such, and within reason, do no particular

harm. The heavy power strokes of the capacious single-cylinder, occurring at long intervals, are far harder on rigid and semi-rigid transmissions than the lighter and more even torque of a flat twin. To quote a rough parallel, would the bevel of an 8 h.p. one-lung De Dion voiturette really keep silent as long as that of the same firm's 10 h.p. four-cylinder? My experience of chain and bearing life on the vertical single does not drive me into silent ecstasies of reminiscence. *Ceteris paribus*, the durability factor of the flat twin should show a vantage over that of singles and V twins.

### The Running of Two-strokes.

I venture to suggest that the correspondents who send us such variegated testimony to the merits of various two-strokes fail to appreciate the true point at issue, namely, the combination of all the virtues in one and the same engine. Eliminating such accidental factors as the design or adjustment of carburetters and lubrication systems, the real problem is the design of the ports. One maker adopts a certain area, location, and relative position for his ports, and gets far more power than most of his rivals; but, very probably, his engine runs hot, and four-strokes at low speeds. Another maker employs an alternative port design, and gets a cool engine, steady two-stroking at all speeds, and so forth; but his engine is sadly deficient in kick, and is a weakling compared with the hotter and less regular engine. A third embodies yet another port design, and obtains marvellous petrol economy, but sacrifices in return some other feature of at least equal importance. Readers will appreciate the fact that every modification of port area and port location is tantamount to a change in valve timing or valve lift or valve area, or even all three; and just as the four-stroke engineers have spent years in developing a satisfactory combination of valve area, lift, and timing, so the two-stroke engineers have a long furrow to hoe. I have sampled innumerable baby two-stroke engines, and I think I may dare to say that we are still waiting for a baby two-stroke engine which will (a) be really economical of petrol; (b) and two-stroke over a genuinely wide range of road or engine speeds; (c) and develop plenty of life and power; (d) and keep cool under hard work. You may get any of these qualities singly in several existing engines; you may get two, or possibly even three, of them combined in one or two specially good engines. But you will not find the quartette in combination on one and the same engine, because no designer has yet evolved a port design which meets all our needs. I hope I am not a cynic, but whenever I read a panegyric of a two-stroke engine with which I am familiar, my experience supplies a "Yes, but . . . ." [here insert the contradictory of (a), (b), (c), or (d), as above]; and if I read a glowing tribute to one of the few baby two-strokes which I have yet to test, I feel in my bones that a five-mile trip on it would suggest a similar reservation.

## OVERHEATING AND SPARKING PLUG DESIGN.

### AND ITS RELATION TO THE USE OF HEAVY FUELS.

**A**S a light car owner I am agreeably satisfied with the modern British sparking plug, but as a motor cyclist I realise that it has many shortcomings. That is to say, that though the modern plug is quite satisfactory when used in a comparatively cool-running car engine, it falls short of actual requirements when contained in the cylinders of an air-cooled motor cycle engine.

In these days, when two-stroke engines are popular and heavy fuels are necessary, something extra special in the way of a sparking plug is seriously required if constantly good results are to be obtained on a long ride. A two-stroke air-cooled engine (and many four-strokes for that matter) is a very hot bit of stuff, and the explosion of a heavy fuel is generally a good deal hotter than that of petrol. The conditions, therefore, are such as to bring motor cyclists to the realisation that the present design of sparking plug is not quite what it might be.

It is not my intention to attempt to advise the manufacturers of sparking plugs how they should go about their business; but it is fairly obvious to any practical rider that the demands of the air-cooled engine have been neglected; and it is quite conceivable that if some genius of the sparking plug world were to lay himself out to design a special air-cooled plug, he would find a ready market—even though the price were in proportion with the novelty.

#### Pre-ignition and Heavy Fuels.

Since the general use of heavy fuels began, a large number of riders have discovered that, though their machines run well for a mile or two on the heavy fuel, strange troubles begin at the end of that distance. If it be a small air-cooled twin, one cylinder cuts out, and if it be a two-stroke, pre-ignition, which seldom has the same effect on two machines, is the result. Pre-ignition is one of the most curious and tantalising problems with which the motor cyclist has to deal. It may stop one's engine dead as though the fuel were suddenly turned off; it may simply cause misfiring and irregular running, or its only result may be an irritating loss of power. Pre-ignition may affect the running of the engine in just the same way as bad carburation, but with this difference—that, while bad carburation can, by dint of perseverance, be set right, pre-ignition, when the sparking plug is at fault, is almost impossible to cure.

Regarding the numerous troubles experienced with heavy fuels, I believe that the majority have their root at the sparking plug. The rider, however, naturally expects bad carburation, and so he attacks his carburettor time after time, probably aggravating the defect. After careful observation for some months

past I have come to the decision that 90% of the troubles experienced with heavy fuels (and one finds them everywhere) are not due to bad carburation at all, but to defects in the ignition system.

#### An Obvious Fact.

This, indeed, is obvious on the face of things. If carburation is satisfactory when the engine is cool, it should naturally improve as the hot air intake and induction pipe become warmed up. Carburation defects, therefore, must be expected before the engine is properly warmed, not after. Sparking plug troubles, on the other hand, do not begin until the engine has reached its maximum temperature, and from that point onward they are likely to continue.

Now a heavy fuel, say white oil or paraffin, while giving a slightly hotter explosion than petrol, will explode at a lower temperature than petrol. In using these fuels, therefore, we are up against two difficult propositions; the first is that the gas in the cylinder will, with the slightest encouragement, explode on compression; the second is that the hot explosion overheats the engine, and consequently any fine protruding point in the combustion head is exceedingly likely to cause pre-ignition.

We have long suspected glowing flakes of carbon deposit of causing pre-ignition, but my engine has no carbon deposit, no rough edges—nothing to cause pre-ignition excepting the fine wire points of the sparking plug. I am convinced that the carburation is perfect, yet when using too heavy a fuel this engine runs abominably after 100 yards on bottom gear. All the symptoms indicate that at irregular intervals the charge ignites before the spark actually occurs—a backfire, or a wasted charge.

#### A Suggested Design.

Obviously, the fine points of the sparking plugs are to blame, hence the foregoing statement that 90% of the troubles experienced with heavy fuels are ignition troubles.

Now there are two things which affect the temperature of the plug points: the first is the amount of metal exposed to the hot gases, and the second is the provision made for conducting this heat away. The heat from the base of the plug is absorbed by the cylinder; if we can keep the base cool so much the better, but the base is not the real offender, because pre-ignition occurs just the same with the Scott engine, and in this case the base of the plug seats in a water-cooled jacket. *It is the central electrode, bedded in a material which is a poor conductor of heat, that is at the root of our troubles.*

**Overheating and Sparking Plug Design.—**

The first sketch shows how inefficient the modern sparking plug is as regards the pre-ignition question. It is a veritable pre-igniter in itself. Surrounded by an insulator, the thin stem of metal has nothing to do but to accumulate heat, and there is absolutely no provision made for conducting such heat away.

The second, while not intended as a proposed design, represents an

A comparison of sparking plugs, showing how the heat could be carried from the point of the central electrode.

idea which naturally occurs to the practical rider. We desire air-cooled plugs. We find that the central electrode is the offending part. The obvious course is to design the aforesaid central electrode so that it will be exposed to as little heat as possible, with ample provision for instantly conducting that heat away and dissipating it.

In this design the plug is so arranged that a very small portion of the central electrode is exposed to the hot gases, while all possible provision is made for conducting such heat as it accumulates towards the head of the plug. I believe that a plug, designed on these lines, would not cause pre-ignition, even on an A.B.C. or Scott engine, and that its use would remove half the difficulties of the heavy fuel question. My experience is that, with a heavy fuel, the modern carburetter, fitted with an efficient hot air intake, fills the bill; all we want is a sparking plug, the central electrode of which will keep reasonably cool. H.M.B.

## AN OVERSEAS CLUB.

A gathering of Australian motor cyclists in the National Park, Adelaide, on the occasion of the first outing of a newly formed motor cycle club.

**A** NEW club, which will develop the social side of the pastime, has been formed among motor cyclists resident in Adelaide, South Australia. Notwithstanding the fact that the members ride various makes of machines, ranging from lightweights to powerful twin-cylinder sidecar outfits, they have adopted the name of the "Social Harley-Davidson Club." Why the Milwaukee firm should be so favoured we must confess to ignorance, particularly as prominent in the photograph reproduced may be recognised an American Excelsior and several British machines, among them Humber, Douglas, and Triumph. There may be some latent reason for this, and Britishers will be curious to hear the explanation.

The formation of the club has for its object the holding of summer outings and social evenings once a month in the winter, when lectures will be given on subjects of particular interest to motor cyclists. Outings for wounded soldiers, too, have been arranged.

Our Overseas mail brought us particulars of the opening run held on the 2nd ult., when the destination was the National Park. There were no fewer than sixty motor vehicles of all shapes and sizes employed to transport a party of 200, and a highly successful day resulted. The membership roll is already over forty, and it is considered a good omen for the future prospects of the club that so many should have enrolled and such enthusiasm have been exhibited on the occasion of the first outing.

## AN ALUMINIUM ENGINE.

A System of Aero Engine Construction having Possibilities for the Motor Cycle.

At first glance these illustrations might be taken for a single-cylinder engine with twin magnetos; it is in reality a six-cylinder aero engine made almost entirely of aluminium.

WILL  
SUCH ENGINES  
APPEAR ON  
MOTOR CYCLES  
IN A FEW  
YEARS' TIME?

**W**E have previously laid considerable stress upon the effect which aeroplane engine design is likely to have upon motor cycle engines in the future, for the ideals are largely similar in both cases, and the methods of construction might also be much the same, although the designs must differ.

An aluminium aircraft engine known as the Wisconsin is a case in point, and end views showing the general construction accompany these observations. Its constructional details should be most interesting to motor cyclists, though there are many points which could not very well be embodied in a motor cycle, e.g., six cylinders and overhead camshaft. For the sake of lightness the engine is largely constructed of an aluminium alloy, the crank case, the pistons, and even the cylinders being of this metal. The cylinders are cast in pairs and lined with hardened steel, the heads being cast integral with the cylinders themselves. The tops of the pistons are well ribbed for the sake of strength, and yet they are light in weight; two rings are fitted, and the gudgeon pins take their bearings in the aluminium alloy itself, and this has proved highly satisfactory. The connecting rods are chrome-vanadium steel forgings machined all over, terminating in big lugs of the four-bolt type.

The crankshaft is of heat-treated nickel-chrome steel, having hollow crank pins to reduce the weight, and the camshaft is of the same material. This is placed above the cylinders, and contained in an aluminium casting attached to the cylinder heads, in which are oil troughs for the purpose of lubricating the cams, which are integral with the shaft, and the operating mechanism; the excess oil is returned to the crank case through ducts. The camshaft runs in bronze bearings.

There are many other interesting features, for which we must refer our readers to our contemporary, *The Automobile Engineer*.

The weight of the engine is 600 lb., and at 1,200 r.p.m. it is capable of exerting 130 h.p., while at 1,400 r.p.m. the horse-power rises to 145. This means that at the latter speed—quite a moderate one for a motor cycle engine—the weight comes out at nearly 4.14 lb. per h.p., or less than 15 lb. for a 3½ h.p. engine. Of course, it is not to be expected that this proportion would hold good for the lower powers, or that a 3½ h.p. engine could be less than 20 lb. in weight, but yet it is evident that a motor cycle engine constructed on these lines would effect a great saving in weight.

### A Sidecarist's Account of a Trip in Perthshire and Inverness.

**A**CCORDING to the sworn testimony of the motor cyclists, the driver of the Napier car in the party was only persuaded to accompany them on the assurance of help in any emergency. At 12.30 one Saturday morning a 6 h.p. Sparkbrook and a 6 h.p. Enfield, carefully loaded up with petrol, provisions, and the necessary implements for catching fish, set forth from Dundee for Tummel Bridge Hotel.

The Napier, with its load of five, probably to ensure arrival before the dinner had entirely disappeared, had set out an hour before, and our object was to overtake it in the neighbourhood of Dunkeld. The day was perfect, and the prospect of a short respite from the conditions of war service made us eager for the bracken and heather-clad hills of Perthshire.

Purring along delightfully in the Enfield, the climb up the Birkie Brae seemed like level ground, but some pot-holes impossible to avoid almost led to a disaster.

#### A Petrol Leakage.

The luggage on our carrier consisted of a tin of the precious fluid, petrol, and it had been strapped and corded so securely (?) by our friends somewhere behind in the Sparkbrook that even Hudini himself could not have removed it inside fifteen minutes. One terrible bump over a sample pot-hole, however, and we had a "trailer" usually associated with a boy and a dog. Pulling up quickly, we saw our two-gallon tin following us at the end of about eight yards of rope and strap, and at each bump leaving a little circle of moisture on the parched road. Locating the leak, we propped the precious tin in the sidecar, thanking the Enfield designer for his thought in providing such extra room, and we then waited the arrival of the "strappers and fixers."

Over the next five minutes we draw a veil, and it was only on the appearance of veal and ham pies, etc., that peace was declared. Once refreshed we again took the lead—we had the only speedometer—for the famous Tullybacart hill and the Vale of Strathmore. We had just commenced the descent of the hill when the "Spark" driver pulled alongside, and with a sarcastic smile suggested that we need not walk any further. With a wave we offered to

follow, but just at that moment a "phizz" made us look and the man in a hurry was forced to draw in at the roadside with a deflated back tyre.

#### A Useful Refinement.

Then the ears of the builders of the Sparkbrook must have tingled, for we gazed in admiration as the proud owner slid out his back wheel, slipped in a new tube, and was ready again in a very few minutes. On we went with the whole glorious Strath before us, away through quaint old Coupar Angus, and thence by the charming village of Meikleour with its ancient cross and famous Brankstone. Then came our turn. Just as we were admiring a lovely farmyard scene another "phizz," this time on our own back tyre, called for attention.

Our prolonged stay in that farmyard was due to tyre troubles, and the remarks of the rustics about our "detachable tyres" added much to the joy or otherwise of the occasion. Having now given the Napier as much start as we could afford we put a little more vim into our pleasure, so that the sounds of the hay cutters and other agricultural implements became entirely obliterated. Caputh and Dunkeld, where the Scottish Horse were resting after their terrible time at Gallipoli, were soon passed, and we wound along the main road to Inverness through some of the finest scenery in the Highlands. The Tay, still in spate from the recent heavy rains, ran some hundred feet below, and the ever-changing views of both river and rock were extremely beautiful.

Hidden from view under the trees alongside a tumbling hill-stream was the Napier and its occupants, the latter packing up the baskets of fragments that are the inevitable results of a feast. When the cheers announcing our arrival had echoed away up the Glen we unpacked our "provision department," and after a wash in the brook partook of a second lunch.

#### A Lusty "Stone-putter."

Meanwhile, the "car cargo" indulged in air-gun practice and "putting the stone," which latter game was terminated when a particularly vigorous member of the

The amateur gypsies preparing the fire in Rannoch Wood.

### In the Central Highlands.—

party "put" the stone right to the corner of the road and nearly sent a vehicle down into the river.

Our flasks (Thermos, please) emptied, and our fragments collected, we set off *via* Pitlochry, and the climb through the pine woods to Queen's View, Loch Tummel. Any strangers who may take this route must exercise great care when turning down from the Inverness road, as the bend is very acute and the hill steep, and immediately on crossing Garry bridge another sharp turn with a stiff hill calls for extra caution. The road here is very beautiful—just a long avenue of pines, but owing to the great demand for timber huge tracts of forest are being cleared, and the drawing of heavy lumber waggons over the roads in all weathers has rendered the surface terrible in places.

### The Queen's View "Mist."

Several of our party had never seen Queen's View, Loch Tummel, and as we neared the locality excitement became evident. "Excelsior" is the motto on this bit of road, for it is a climb all the way, but just as we saw the summit a real Scotch mist and heavy drizzle blotted out the whole

After a smoke we unpacked the rods, adjusted the bait, and went our several ways to fish—but not all to catch, alas! One novice returned, weary and wet, with a single trout. Another member also announced one capture, and would have caught more except for the fact that his next fish was whipped out of the stream so vigorously that it looped the loop several times round a high branch of an overhanging tree, and in proof of the story "is hanging there to this day." Our fisherman proper reported—and produced—fourteen, a fact that made us all feel proud.

Supper on the seats outside the hotel, with the cloud-capped hills gradually disappearing from our view, a

(Upper) Starting from Tummel Bridge Hotel. The sidecars are a Sparkbrook and an Enfield  
(Lower) Lunch on the road that runs alongside the shores of Loch Rannoch, under the giants of the Black Wood of Rannoch.

scene. However, we left our machines and climbed out to the edge of the jutting crag, pointing out as well as we could the points of interest. Had there been a visitors' book we would have copied the entry of a Ben Nevis climber under similar circumstances who wrote, "I've seen the mist but 'mist' the scene." A short run at the legal limit down the side of the loch, and with a sharp turn we are jerked over the well-known hog back bridge to our home for the night.

One of the benefits of motor cycling that is not sufficiently emphasised is the glorious appetite and sound digestion that always mark a long run, and the waiting maid at Tummel Bridge Hotel would bear eloquent testimony to the efforts of our party at the dinner table.

quiet smoke, and then off to bed. A hearty "ham and egg" breakfast—and Tummel Bridge is famed for its H. and E.—and then began preparations for our journey.

### A Stiff Climb.

At 10.30 we waved our "farewells" and set off for Loch Rannoch. The road is of good surface, and winds through a lovely glen to Kinloch Rannoch.

The hill at Dunalastair, however, is a terror, and needs very careful driving. The gradient at the bend must be about 1 in 4. Of the road round Loch Rannoch it is difficult to write. Certainly it is one of the most charming lochside roads in Scotland, and on this lovely morning, with the boatloads of farmers and crofters in their Sabbath "bravs" singing on their way to church, it was lovely indeed. About five miles up the south side of the loch we chose a spot for lunch, and awaited the arrival of the Napier. Slowly the minutes dragged on—half an hour passed and still no news, and we had almost given up hope when the truants roared up to us. They had gone straight on past the end of the loch for four or five miles before discovering their error.

Luncheon in the shadow of the remaining giants of

Polishing up in the Tummel Bridge Hotel yard for the second day's run. Note the effective windscreen on the Sparkbrook sidecar.

the Black Wood of Rannoch, a little fishing but no fish, a little potting at the target, and then away we went again.

We set off for the long and heavy climb over the shoulder of Schiehallion to Whitebridge. The district here is just a chaos of hills and glens with corkscrew roads, but of such beauty that the equal is seldom seen. On the summit we stopped and added our mite to the cairn that is rapidly growing, and to admire the

glorious expanse of mountain, moor, loch, river, and forest.

From Whitebridge we have a four miles descent to Coshieville, and there joined the Tay Valley and ran along by the cultivated land to Weem, where we had tea under the beeches.

By this time the rain had begun to fall, and after waiting threequarters of an hour for the "Spark" and the Napier, we set off for home.

## News from a "Tank" Operator.

**A** GUNNER of the Heavy Section, Machine Gun Corps, the section operating the famous "Tanks," writes from France as follows:

"Our daily life goes on satisfactorily here. We are working rather harder now on a part of our training that had fallen into arrear somewhat before we left England, but there is nothing to complain of. In fact, compared with the men in the trenches, we are having a very easy and comfortable time, though the folk at home might consider it a rough life enough.

"We are all briskly employed in some sort of work or another. Fortunately the weather has been brilliantly fine and warm, with congenial autumn sunshine all day long, so you can imagine how this, and the fine performance our corps put up in its first experiences of action, has bucked us all up. The men are all as cheerful as can be, and one could not wish to be among a better lot of fellows. This is a very

quaint little French village in a typically pleasant community. Everybody lives happily together in tumble-down little houses, with the manure heap just outside the back door and the pigs and fowls wandering in and out of the kitchen quite like members of the family. The

folk are desperately hard-working and thrifty, but are very civil-spoken. I am trying hard to improve my French; such an opportunity must not be lost. There is a fine old chateau hereby, and a church with a fantastic tower and spire just like an illustration of H. R. Millar's in the 'Strand' fairy stories. There are a few cafés where light wine and sour beer are bought. We are an early-rising corps. Reveillé at 6 a.m., and most of us are in bed by 9 p.m. The papers give very good accounts of the performances of our corps, and we are all delighted to think that our comrades have made so brilliant a beginning. One feels proud of belonging to a corps that is helping to make history."

Sgt.-Artificer C. Collins, A.S.C., M.T., a Coventry motorist attached to armoured cars, who enlisted in the Motor Machine Gun Service during the early days of the war. Owing to an accident, Collins is at present in hospital in England. His three brothers and four brothers-in-law are serving with the Colours.

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

### To Assist Pedalling.

Would a two-stroke, 2in. x 1½in., develop enough power to be used as a cycle motor after the style of the J.E.S.? Please say the approximate power under good conditions.—R.L.B.

Such an engine would have a capacity of about 75 c.c., and if well designed and soundly constructed should answer your purpose. It should give about ¾ h.p.

### Slow Running.

(1.) I have a 1914 6-8 h.p. Rex, fixed gear, solid front forks—the firm's Brooklands model. No doubt you know the kind of machine. As I wish to get very slow running, would you be kind enough to give me your opinion on the matter? I have a B. and B. carburetter on now, but as I want to go beyond carburation to obtain slow running. (2.) I thought of a Philipson pulley. What would you suggest using?—W.L.E.F.

(1.) To obtain slow running it is necessary to be very careful to eliminate all air leaks between the carburetter and the engine, and to use a small jet. The spark can also be retarded to some extent, but to run for long on a much retarded spark is likely to cause overheating. Do not set the plug points too near together. (2.) We can thoroughly recommend the Philipson pulley.

### Lighting.

I should like to know whether a motor cyclist has any right on the road if he pushes his machine after lighting-up time without front and rear lights. If he has not, what is he to do with his machine, if there is no house in the immediate neighbourhood? Recently I had to push my motor bicycle because the water had got in the gas pipe of my acetylene generator. A pedal cyclist ran into me while I was pushing my motor cycle, and was thrown badly. Has he any claim? I was pushing the machine on the left side of the road. He was riding too fast for safety, and did not see me till he was right upon me, though he had a good light which would undoubtedly shine on my rear light glass, which was knocked off by the force of his impact.—N.F.G.

The latest ruling is that a bicycle (and we presume a motor bicycle would be included) may be pushed when unlighted, provided that it is kept at the extreme left-hand side of the road, but, if your mishap occurred before this ruling, we are afraid that you would be liable, as the motor bicycle then came into the same category as a handcart, which must show

a white light to the front and a red light to the rear. It is rather a difficult question to answer, but this is certainly a view which the Courts might take. Of course you might plead that the cyclist was riding faster than he ought to have done, but it would be very hard to persuade a Court that he was responsible. The push cyclist would always be given the benefit of the doubt in a case against a motorist.

### Petrol Consumption.

I have been troubled for a long time with an excessive petrol consumption. The machine is a 1915 model, twin-cylinder, three-speed, with cylinders of 70x64.5 mm. bore and stroke, c.c. 496, Amac one-lever carburetter. I have taken an immense interest in motor cycles since I became a rider in November, 1907, and this will be the ninth machine I have had. I had a 1911 P. and M. (sold recently), which did me yeoman service, and with an Amac carburetter has been running 110 m.p.g. I began by fitting a new carburetter, viz., a pilot jet B. and B., really a magnificent hill-climber, but I could not improve on 50 m.p.g. I carefully noted that the joints to cylinders were air-tight, etc., and by very careful driving I once got 62 m.p.g. average. I then obtained an Amac carburetter (standard), latest model, 28 jet, and found an improvement, though it did not climb hills as well. On the advice of a friend, I fitted a

25 jet, when I noted it would then take full air, but the climbing powers were, of course, further reduced. I managed to get about nineteen miles to a quart of petrol, which works out at about 76 m.p.g.—best I have done yet. The timing of valves and spark has been noted twice, and corrected and checked in accordance with the makers' directions, and all seems quite in order. The compression of the front cylinder is not so good as the rear, and as the inlet valve guide appears worn I am renewing it. Would this give rise to a marked increase in petrol consumption through air leakage? I know the extreme importance of having the junctions of the T inlet pipe and the cylinders absolutely air-tight. Is it also needful that the junction of the T inlet with the carburetter shall be as air-tight?—J.H.

You cannot expect quite the same fuel efficiency in a twin as in a single, but you certainly ought to get better consumption than you have been doing. It is important that all joints between the carburetter and engine should be air-tight, but a leak would be more likely to affect slow running than petrol consumption. We are inclined to suspect a leak in the tank or tubing. If you put a little paraffin with the petrol, this will easily be detected if it exists. A high compression tends to economy, and, of course, there must be no leaks in the engine past the piston rings, valves, valve caps, or sparking plug.

Gnr. A. Templar, of the — Light Armoured Motor Battery, M.M.G.S., Egyptian Expeditionary Force, with his Triumph in the desert. In writing he remarks that the scene is by no means typical, for in most parts either loose stones or dunes abound. Note the skeleton remains in the foreground.

**A Cracked Cylinder.**

?

I have a 4½ h.p. single-cylinder 1916 model machine, the compression of which has not been very good lately. I removed the exhaust valve with an idea of grinding it in, and was surprised to find a crack in the cylinder in the wall between the exhaust valve and the main chamber. I presume this has partly to do with the bad compression, and would be glad of your opinion as to the cause, and whether there is any harm in continuing to run the machine.—P.J.T.

This, of course, would account for the loss of compression of which you have been complaining. The best plan would be to submit the cylinder to a firm of welders, and they will tell you on inspection if the crack can be welded or not. It may eventually extend, and there will be further loss of power. It is a matter which should be seen to as soon as possible. The cause is probably due to overheating, and consequent unequal expansion of the metal of which the cylinder is composed.

**Loss of Compression.**

Q.

Having reason to be dissatisfied with the compression of my 1916 6 h.p. twin (it could be wheeled along quite easily on top gear), I decarbonised the cylinders and piston and ground in the valves. I find now, after a run of fifty miles, that the compression is improved, although I can still wheel it along with top gear engaged without much effort. The front cylinder does not run with nearly so much power as the rear one. On the stand, at comparatively low speeds, the engine will instantly stop if the back cylinder is shorted, but if the throttle is opened about half it will continue to fire, but rather weakly. The spark is very strong, and the plug seems all right. The valves are correctly adjusted, and the inlet pipe, under the oil test, appears perfectly air-tight. The rings are quite good, and clean right round. I use a Binks three-jet carburettor, and the only reason I can think of as the cause of the trouble is that the charges of gas to each cylinder are not of equal strength. When the front cylinder is shorted it makes no appreciable difference to the running of the engine on the stand. I am completely at a loss as to what to do, and I should feel greatly obliged if you would suggest a remedy. I always understood that it required a good deal of effort to push a motor cycle against compression.—PUZZLED.

The trouble of which you complain is rather puzzling, as everything appears to be satisfactory from what you say in your letter. Are you sure that the valve clearances are correct, as unless the valves close absolutely you will get a leak of compression? If the leakage is not at the valves, valve caps, or plugs, it must be at the piston rings. It is rather difficult to get these V twin-cylinder machines to run with each cylinder giving equal power, but there should not be much divergence in the case of a modern V twin with mechanical inlet valves. It is just possible there might be a blow-hole in your cylinder.

Q.

**Auto-wheel Licences.**

Could you tell me what licences are required for an Auto-wheel?—F.L.

The licences for an Auto-wheel are the same as for any other motor cycle, viz., Inland Revenue £1, driving licence 5s. In addition to this, 5s. must be paid for registration. The first two are paid annually. If, however, the Inland Revenue licence is taken out after October 1st the charge for the remainder of the year is 10s.

ILIFFE &amp; SONS LTD.

**READER'S REPLY:****Automatic Inlet Valves.**

Like "L.F.I." in your "Questions and Replies" columns I had an automatic inlet valve 5-6 h.p. twin which gave a lot of trouble by blowing back past the valve case seatings, which had only a very narrow ledge. The copper asbestos washers supplied by the makers were perfectly useless. The tighter the cap was screwed the worse the trouble. Seccotine, gold size, and various things were also tried with asbestos cord, but were not always satisfactory. Eventually I found it quite cured by discarding the asbestos and using a thin rubber washer cut out from an old I.R. hot water bottle. Put the washer in position, and screw the cap lightly. Start the engine, and as the rubber gets melted with the heat gradually screw down the cap until there is practically nothing between the valve

casing and the seating. This, in my case, would last until I wished to remove the valve for cleaning.—E.J.C.

**BRITISH MOTOR CYCLES FOR THE ALLIES.**

Recently the War Office authorities sent urgent instructions to Messrs. Douglas Bros., Bristol, for a large number of motor cycles, and our picture shows G.W. Railway employees who in a few hours made up a complete train of Douglas machines.

# The 1917 Sun Two-stroke Lightweight.

General Excellence maintained with Numerous Improvements in Detail.

THERE seems to have been a tendency of late to relegate the two-stroke machine to the background, and we have, not infrequently, heard the opinion that its popularity will not last. We are at a loss to know on what foundation such statements are made, unless it be the unfortunate experiences of those who have discovered that some two-stroke models were carelessly designed and slung together in a very reprehensible fashion. But the thoroughly good two-stroke engine will always command a considerable popularity; its even, smooth running, quick acceleration, and simplicity will outweigh any minor disadvantages, most of which are rapidly being eliminated; noisy exhaust, oil slinging propensities, extravagance in petrol, and carbonisation now cause very little, if any, trouble to the owner of a modern well-designed engine. The Sun Cycle and Fittings Co., Ltd., Aston Brook Street, Birmingham, for several years past have marketed a

(Top) The decompressor or release valve.  
(Below) The new pattern silencer of curious shape.

very reliable series of lightweight models, and the principal features of these are being retained in the new models for 1917.

## The Engine Unit.

The heart of the machine is still that excellent engine, the V.T.S., of British manufacture, dimensions  $70 \times 70$  mm., giving 269 c.c., or approximately  $2\frac{1}{2}$  h.p. The piston is improved by the fitting of

The latest type of engine complete with the new silencer, and incidentally showing method of mounting the British-made magneto.

deeper rings,  $\frac{1}{4}$  in. in place of  $\frac{3}{8}$  in., and the taper gudgeon pin is still further held by split cotter pins at each end, the sides of the piston being recessed to accommodate them. The crankshaft and connecting rod, phosphor bronze bushes, cylinder and transfer ports remain as before. A very neat type of decompressor or release valve is fitted, operated by Bowden cable. The casting of the crank case, magneto chain case, and magneto platform all in one piece was always an excellent feature of the V.T.S. unit, and its retention is a matter of course. A British-made magneto, the Thomson-Bennett, is fitted as standard, a sign of the times which points to the rapid advance of British magnetos, and gradual

ousting of the numerous foreign makes. The silencing of the exhaust is one of the most notable improvements, an unusual type of exhaust box being employed. It is rectangular in section and tapers from front to back; the interior is divided into two chambers, and the exhaust ultimately reaches the open air through a flat-ended tube.

An Albion countershaft gear box is incorporated in the two-speed models, driven by Hans Renold chain running in an oil bath gear case. A  $\frac{3}{4}$  in. Dunlop belt completes the drive.

## Mudguarding.

Perhaps the chief alteration in appearance is the back mudguard and carrier. This guard is now made 7 in. wide, and flatter in section than usual, set well up to give plenty of clearance, and a neat grooved fitting to the bottom stays is added. Side wings are omitted, and it is next to impossible to get the guard choked up with mud. The carrier is

On the 1917 Sun the rear mudguard is of exceptionally wide dimensions.

Flywheel side of the 1917 model  $2\frac{1}{2}$  h.p. Sun-Vitesse lightweight.

set further back and slightly lower, and forms in one with the guard a very substantial piece of work. In other respects the various parts remain as in 1916: Amac or B. and B. carburetter, lubrication by separate supply through Best and Lloyd sight feed to a shelf in the top of the crank case, and by drilled ways to the main bearing, and through the crankshaft to the big end. Tank, frame, Druid forks, brakes, and all the usual fittings are of noted British manufacture, and go to complete an excellent specimen of the two-stroke lightweight motor cycle. As must be expected in these times, prices are increased somewhat, the two-speed model as described being marketed at about £39.

It is very interesting to note that a number of these machines are destined for Portugal, our ally being one of the latest to buy in the English market.

## A Simple Attachment to Facilitate the Use of Paraffin.

**A** FURTHER addition to the already long list of devices for assisting in the use of heavy fuels is being made by Messrs. A. Pilkington and Co., 56, Aston Road, Birmingham. Simplicity is its particular advantage, and it does not necessitate the cutting about or derangement of the existing carburetter or induction pipes. It consists of a brass T

A device, easily attached, which enables heavy fuel to be used with the existing carburetter.

union with copper connecting pipes, one tapped into the induction pipe, one turned into the fins to supply hot air, and the lower pipe connecting to a small auxiliary tank of petrol. Into the centre of the brass junction is fitted a small needle valve, controlling the petrol supply.

To start up, this valve is set to give a very small supply; the best position is easily found by experiment, and the petrol turned on. This will give sufficient supply for slow running, but more power can be obtained by opening the needle valve. The rider can proceed for a short distance, a hundred yards or so is all that is necessary, until the engine has warmed up, when the change to the heavier fuel can be made without dismounting. First open the throttle, and for a yard or two a mixture of petrol and heavy fuel is in use, then close down the needle valve and the engine will carry on without hesitation. It is, in fact, a miniature carburetter, simple and perhaps primitive, it is true, but none the less efficient. The actual vaporisation of the heavy fuels is left to the ordinary type of carburetter. Messrs. Pilkington and Co. also supply a very good type of auxiliary tank, suitable for use in conjunction with this starter, a description of which appears in our issue of September 28th last.

## CATTLE ON THE ROAD AT NIGHT.

Lights to be Carried by Persons Driving Animals. A Real Danger Minimised at Last.

**A** MOST important regulation under the Defence of the Realm Act has lately been made, which deals with the question of cattle driven on the highway after dark. We refer to the matter editorially this week. The order reads as follows:

(1.) Every person who shall cause or permit—

(a) Any horse, mare, gelding, mule, ass, bull, ox, cow, heifer, steer, or calf (in this Order referred to as cattle); or

(b) Any sheep, lamb, goat, kid, or swine to be driven or led, during the period between half an hour after sunset and half an hour before sunrise, along any street, highway, or road to which the public have access, shall provide a lamp capable of showing a white light both to the front and to the rear, which lamp shall be carried at the rear of the animal, herd or drove.

Provided that, in the case of an animal or animals not exceeding four in number which are being led, the lamp may be carried by the person leading the animal or animals, instead of being carried at the rear.

(2.) If the herd or drove contains—

(a) More than twenty head of cattle, or

(b) More than 100 head of sheep, lambs, goats, kids, or swine,

he shall provide a second lamp also capable of showing a white light to the front and to the rear, which shall be carried in front of the herd or drove.

(3.) The person in charge of the animal, herd, or drove shall see that the lamp or lamps are properly trimmed and lighted and are carried in such a manner that the light is at all times visible for a reasonable distance, without obstruction, in the direction in which the animal, herd, or drove is proceeding, and also in the reverse direction; and the person carrying any lamp shall carry it accordingly, and shall, on the approach of any vehicle, swing or wave the lamp so as to indicate that there is an obstacle on the road.

This Order shall not apply in the case of an animal which is being ridden or which is drawing a vehicle, or led at the

rear of a vehicle, on which the lights required by law are displayed.

This Order shall take effect on and after 22nd October, 1916, and shall apply to the whole of England and Wales.

This Order may be cited as the Lights (Driving of Animals) Order of 11th October, 1916.

A MUD-COVERED  
DESPATCH RIDER'S  
DOUGLAS.

This photograph will assist readers at home in realising the very bad road conditions in the French war zone during the winter months. The rider is L.-Cpl. J. F. Harvey, formerly in the motor trade in Liverpool, who joined the army three days after the outbreak of war.

**TIMES TO LIGHT LAMPS.**

GREENWICH TIME.

Oct. 26th	...	5.14 p.m.
" 28th	...	5.11 "
" 30th	...	5.7 "
Nov. 1st	...	5.3 "

**The Latest.**

Lights on cattle! After many years agitation, an order has been issued to the effect that all cattle on the roads at night must be accompanied by a person carrying a white light.

**Cooling the Plug.**

A water-cooled sparking plug is suggested in *The Light Car* published yesterday (Wednesday). Evidently the plug question is a troublesome one among light car owners as well as motor cyclists.

**Dispensing with the Road Test.**

Motor cycles are still tested on the road, but there is a possibility that a good deal of preliminary road tests may be dispensed with in the future if an electrical shop test of the completed machine be adopted. Such a system is described in last Wednesday's issue of *The Light Car*, showing how the power can be tested at the road wheels.

**Special Road Warning.**

A resolution was recently considered by the County Council of Hants. asking for a speed limit of ten miles per hour for the village of Liphook. The Council decided not to apply for a speed limit order, but to request the police authorities to prevent dangerous driving. The A.A. and M.U. has been requested by the local Council to assist in making this decision known to motorists passing through the village of Liphook.

**Increased Taxation—Abroad.**

The Australian Government proposes to increase the licence fees on motor cycles, and to prohibit all speed trials. It recommends these drastic proposals because, in its opinion, races and overloaded sidecars seriously damage the roads. Moreover, it contends that motor cycles are the noisiest machines on the road, hence the proposed prohibition of trials.

A special sub-committee has been appointed by the Victorian and N.S.W. Motor Cycle Clubs to prevent, if possible, these proposals being carried into effect. It points out and illustrates a report showing the serious damage done to the roads by untaxed horse and bullock teams.

To suggest that rubber tyres damage some of the Australian roads is worse than accusing a camel of damaging a desert tract in the Sahara.

**An Error.**

A case recently came to our knowledge of a motor cyclist being caught in a trap and accused of doing over twenty-two miles per hour, whereas his speedometer never exceeded seventeen miles per hour at the outside. An error of one second was found between the two watches, and the victim was exonerated.

**Another Problem Solved.**

We have heard of a rider whose inner tube blew out, resulting in a hole several inches long, and quite beyond ordinary patch repair. He solved the problem by tying string round the tube tightly an inch or two from each end of the burst. He then wrapped his handkerchief tightly around the tube at the hole. This primitive repair enabled him to reach home safely, and without damage to the tyre.

**Cycle Cars Very Old.**

The writer of the article on "Automobiles" hides no simple facts in his contribution to the new book "Eclipse or Empire" just published. Touching upon the origin of cycle cars, this is what he says: "Cycle cars were originally British, but failed through lack of financial and manufacturing support. They were reintroduced in France, and again taken up and brought to maturity here, whilst the light car, as a development from them, is entirely British, and the British product is supreme."

**SPECIAL FEATURES.**

NEW DESIGNS (Illus.).

IN THE CENTRAL HIGHLANDS.

MILITARY NOTES.

**Report of Self-Sealing Rubber Co., Ltd.**

The twenty-first annual report of the Self-Sealing Rubber Co., Ltd., shows that the net profit for the year's working was £4,000. With the last year's balance of £299, and writing off income tax, the declared dividend is 12½% free of income tax. The sum of £2,511, less the directors' remuneration, is carried forward to next year's balance. A very satisfactory year!

**The Second-hand Shows.**

The Management Committee of the Manchester Automobile Club has given its approval to the forthcoming shows of second-hand cars in London and Manchester. This approval, especially applies to the Manchester Show, which will be held in the Exhibition Buildings, Royal Botanical Gardens, from December 1st to 9th of this year. It is hoped, therefore, that motorists in the Midlands will do their best to support the patronage of the Club Committee, either by visiting the show or by entering such cars as they may wish to dispose of, in order that the event may be an unqualified success.

Two hardened New Zealand campaigners—Cpl. A. J. Davies (left) and Cpl. F. C. Garland. After despatch riding in Egypt, New Zealand and the Dardanelles, they are back again in England, with a mileage of 40,000 to their credit. Their machines are 2½ h.p. Douglasses.

**More New Models in This Issue.**

Two entirely new designs are described and illustrated in this issue. The new V type two-stroke Vitesse engine is likely to create considerable interest, as this engine has been on the road undergoing private test for nearly two years.

**The National War Funds.**

At the week-end the principal war funds stood as follow:

The Prince of Wales's Fund (£3,468,925 distributed)	£5,966,954	0	0
The British Red Cross Fund	4,489,615	0	6
Tobacco Fund	115,955	0	0
The Queen's Work for Women Fund	170,798	4	2
Kitchener Memorial Fund (over)	358,000	0	0

**The Admiral Arbuthnot Trophy.**

The A.C.U. is at the present moment in negotiation with Lady Scott, the widow of the famous explorer and a well-known sculptor, for the execution of the statuette which is to form the trophy. It seems peculiarly apt that Lady Scott should be invited to undertake this work, being herself the widow of a distinguished naval officer.

**The Question of Bearing Pressures.**

We have received from Mr. J. L. Norton a communication on the question of bearing pressures in relation to long stroke engines. It will be remembered we published an article last week on the subject, and Mr. Norton takes exception to certain statements made, and says the article is based on erroneous assumptions, and that vital factors have been omitted. Mr. Norton is too occupied at the present time to write the necessary lengthy explanation of his assertions, but promises to do so as soon as an opportunity occurs.

**The Effect of Naphthalene Balls.**

In view of the attempts made by certain firms to place on the market multi-coloured balls smelling, and sometimes looking, like moth balls, which are claimed to remove carbon deposit from the pistons and cylinder heads of internal combustion engines, our sister journal, *The Autocar*, recently sent a sample box of these to Faraday House, whose experts report as follows: "The tablets consist of naphthalene ( $C_{10}H_8$ ) only. We consider that the tablets could not remove carbon deposit from the piston heads and combustion chambers of an internal combustion engine. The tablets are not of uniform weight. The mean weight of three tablets was found to be 1.48 gm. When this amount of naphthalene is dissolved in a gallon of petrol, the maximum increase in calorific value is 0.04% (i.e., 1 in 2,500, practically nil). The result would be the same with a mixture of paraffin and petrol. The figure given above shows that there could be no appreciable increase in the mileage obtainable by the addition of one tablet to a gallon of petrol. Our experience with very similar materials in actual engine tests entirely confirms the conclusions given above. (Signed) ALEXANDER RUSSELL, Principal."

**Petrol Permits in Ireland.**

We are informed that in Ireland it is necessary to have a police permit to purchase petrol in addition to the usual licence which is issued by the Petrol Committee on payment of the tax of 6d. per gallon. Steps are also taken to ensure that traders do not supply petrol in excess of the quantity authorised by the police permit.

**Singles v. Twins.**

The controversy started by "Road Rider" on the subject of the survival of the single-cylinder machine continues to produce a large number of letters, only a selection of which we are able to publish. Mr. J. L. Norton enters the arena this week, and, of course, champions the single, "the most mechanically and thermally efficient type of engine in use to-day." He asks the mileage per gallon of various 500 c.c. twins, as compared with singles of the same c.c.

**Single Cylinders.**

So far from the 500 c.c. single entirely disappearing, we heard last week that a firm hitherto specialising in big single-cylinders will enter long market a 500 c.c. mount. The post bellum 500 c.c. single-cylinder machine should be a great advance over the same sized engine of pre-war days in the light of the knowledge recently gained on the subject of ultra efficient engines.

**Donations Wanted.**

We are in receipt of an advance copy of an appeal for donations for the Cycle and Motor Trade Benevolent Fund; secretary, Mr. A. J. Wilson, 154, Clerkenwell Road, E.C. In issuing the appeal for donations Mr. H. W. Dover, of Northampton, the president, is following the example of last year's president, Mr. Harry Smith, in postponing the customary banquet until after the war. Without being a war charity the Fund has, in addition to its other beneficent activities, which have been uninterruptedly maintained, assisted in numerous cases of distress caused solely by the war. In many cases weekly allowances are being made to dependants of subscribers serving in His Majesty's Forces, while grants have also been made for subscribers on joining up to enable them to meet liabilities which have not been allowed for by the various State schemes. Together with the literature sent we have received a small booklet containing a few letters of thanks received by the Benevolent Fund during the last twelve months. Donations may be sent either to the secretary or to Mr. H. W. Dover.

ties which have not been allowed for by the various State schemes. Together with the literature sent we have received a small booklet containing a few letters of thanks received by the Benevolent Fund during the last twelve months. Donations may be sent either to the secretary or to Mr. H. W. Dover.

**Petrol Prices.**

The current prices of motor spirit in England and Wales generally are: First quality, 2s. 10d.; second, 2s. 9d.; third, 2s. 8d. per gallon. Motorists who are asked to pay more should write to the secretary of the Motor Trade Association, 157, Great Portland Street, London, W. In Ireland and Scotland prices vary according to the district.

**The Dixie Magneto.**

It appears that certain American magnetos imported since the outbreak of war had German magnets. A naval officer has again brought the matter to our notice, and we have elicited a reply from a firm of agents in this country, who state that the Government Departments are now satisfied that the magnetos imported into this country are entirely of American manufacture.

**Increase of Imports in N.S.W.**

During the first half-year of 1915 and 1916 there were imported into the State of New South Wales motor cycles to the value of £20,498 and £36,407 respectively, representing an increase of £15,909. Rubber goods, chiefly tyres, during the same period increased from £59,034 for the first half-year of 1915 to £335,220 in 1916, this huge increase no doubt being occasioned by the absence of German-made tyres, and British makers wisely seizing their chances.

**Our Substitution Scheme.**

At this juncture, men are as much the coins of the nation's wealth as those of silver and gold. To the manufacturer engaged on munitions of war the first is indeed of more importance than the last, and as difficult to get. Those in need of assistance in this direction are reminded that the Editor of this journal has a list of experienced motor cyclists unfit for, and discharged from, military service, which he will be pleased to submit to any manufacturer who is in need of more hands or wishes to substitute eligibles by ineligible.

**Street Accidents at Night.**

We should say that in the case of 90% of the accidents to pedestrians who cross the darkened roads at night the drivers of motor vehicles are not to blame. Pedestrians often cross a street where there is no lamp, walk in the roadway instead of on the footpath, and cross over without looking both ways first of all. There would be a marked decrease in the number of accidents if it were laid down that all drivers travelling at a reasonable speed, and against whom no act of carelessness could be alleged, were exonerated from all responsibility in the case of a person being run over. If such were the state of affairs the man crossing the street would take greater care of his own safety, and much lighten the burden of the motorist who is compelled to drive after dark.

**A YOUTHFUL RIDER OF A LIGHTWEIGHT.**

Master George Dalmeanic, aged 5, a member of an American troupe of trick cyclists, with his specially constructed lightweight which he rides on both streets and stage.

## MILITARY NOTES.

### ITEMS OF INTEREST FROM CAMP AND BATTLEFIELDS.

#### A DESPATCH RIDER'S IMPRESSIONS.

THE Editor has received an interesting letter from Cpl. W. Pratt, the erstwhile P. and M. exponent, who was formerly a lorry driver with the A.S.C., M.T., more recently an instructor at home, and is now out in France again with the Heavy Section, Machine Gun Corps. At present he is acting as a despatch rider. He tells us he has many an interesting tale to impart, but, as he points out, at present secrecy forbids. Pratt says, "You may guess I am interested, and I know you are, on account of your connection with this section." He goes on to say that things are very, very different from when he was out in France last year. The artillery is amazing. It is one incessant roar, and one needs to be near the fighting line to realise its effect. He winds up by stating that the roads are indescribable.

#### TANK CREATORS—STILL THEY ARRIVE.

ALTHOUGH we published in our last issue a statement by Mr. Lloyd George, setting forth the names of persons chiefly responsible for the design and introduction of the "Tanks," we notice that in reply to a question asked by Capt. Burgoyne in the House of Commons as to whether the idea originated with the R.N.A.S., Dr. Macnamara, Financial Secretary to the Admiralty, stated that:

"There is no doubt that the idea of using armoured cars for trench warfare occurred individually to several people, and all the Admiralty can do is to take what appears in the official records as to who was responsible.

"The idea was suggested by officers of the Royal Naval Air Service from their experience of naval armoured cars in Flanders in the early days of the war. After various experiments by officers of

Cpl. W. Pratt, A.S.C., M.T., a popular competition rider before the war, mounted on a Douglas. Usually he piloted a P. and M. motor cycle.

the R.N.A.S., the late First Lord of the Admiralty (Mr. Churchill) instructed Mr. D'Eyncourt, the Director of Naval Construction, to undertake the design of a tank, or landship, capable of carrying out certain definite performances.

"The officers of the Air Dept. at the Admiralty primarily concerned were Commodore Sueter, Wing Commander W. Briggs, and Squadron Commander T. G. Hetherington.

"While the principal credit for the design of the 'Tanks' now being used at the Front rests with Mr. D'Eyncourt, the latter has mentioned the following gentlemen as rendering him valuable assistance:

"Mr. W. O. Tritton (Managing

Director of Messrs. W. Foster and Co., Ltd.); Lieut. D. C. Wilson, R.N.A.S. (now Maj. Wilson, M.G.C.); Mr. P. Dale Bussell, Contract Dept., Admiralty; Lieut. A. G. Stern, R.N.A.S. (now Lt.-Col. Stern, M.G.C.); Capt. Symes, M.G.C.; and Mr. F. Skeens, Acting Assistant Constructor."

#### IN THE TANKS.

THE Editor has received the accompanying letter and photograph from Gunner W. Hudson, who, together with his five colleagues, is a member of the Heavy Section, Machine Gun Corps. Curiously enough, the letter was censored, and certain deletions made, by Sec.-Lt. H. B. Elliot, who was formerly connected with *The Motor Cycle*. He writes:

"I have been asked by several of the boys on the enclosed photograph to send same to you, as they are six of the boys you passed for enlistment at Coventry last year, and all are out here doing their 'little bit.'

"The photograph was, of course, taken in England before embarkation, but we have all forgotten where.

"Curiously, six counties are represented, and all are very great friends, who did not know of the others' existence until they met at Coventry.

"I shall be glad if you can return photograph; all six send their wishes for the further success of *The Motor Cycle*."

#### A POSER.

A question from the examination paper for candidates for commissions in the M.T., A.S.C.: "The sparking plug on your Triumph cycle becomes unserviceable; you have no spare. How would you act?"

Six counties are represented in this group of men enlisted in the Heavy Section, M.G.C., by the Editor of *The Motor Cycle*. (See accompanying letter.)

A Canadian Scottie helping a Clyno ammunition sidecar out of a difficulty. This official photograph issued by the Canadian War Records Office shows the appalling state of the roads. Correspondents often attempt to convey an idea of the muddy surfaces, but the photograph reveals fully the unspeakable difficulties of transit. Even the caterpillar "tanks" would have trouble here!

#### A MOTOR CYCLIST THE FIRST TO CROSS THE ISONZO.

WE learn that Motor Cyclist Gino Ottoboni, of a Bersaglieri Cyclist Battalion, was the first motor cyclist to cross the Isonzo Bridge on his  $2\frac{1}{2}$  h.p. Frera, on the occasion of the taking of Gorizia. He says, "I put the first Italian wheel along that road, and it was certainly a great honour for me since the morning of May 1st, when I first began to work on this front."

#### A.S.C., M.T.

PROSPECTIVE recruits for the Motor Transport Section should note that, for the present, men passed in Class A cannot be accepted in this branch of the A.S.C.

#### HEROES OF THE "TANKS" HONOURED.

CAPT. A. M. INGLIS has been awarded the D.S.O. for having brought his tanks forward over very difficult ground. Although one of the wheels of his tank was blown off by a shell he succeeded in reaching his objective, and manœuvred through the whole operation.

Sec.-Lt. G. O. L. Campbell, on the occasion of his tank breaking down, removed all the guns to his commander's tank, and remained with him throughout the entire operation, personally taking charge of one of the guns. For this he receives the Military Cross.

#### R.F.C. REQUIREMENTS.

SKILLED fitters of all classes, as well as skilled blacksmiths and copper-smiths, are the only trades at present open to prospective recruits in the Royal Flying Corps. The need of the former is urgent. Men in category A are not now accepted as car drivers.

#### AFTER TWO LISTS OF INVENTORS.

ACCORDING to a letter written to the daily press by Mr. C. W. Pennell, chairman of Messrs. William Foster and Co., Ltd., Dr. Macnamara's statements as to the origin of the "Tanks" are disputed. Mr. Pennell claims that the credit for the only successful design of "Tank" is entirely due to Mr. W. A. Tritton, managing director of Messrs. W. Foster and Co., Ltd., and Maj. Wilson, and that the first "Tank" was built solely by Messrs. William Foster and Co., Ltd.

Mr. Pennell adds "that the idea of a protected and movable fort has been going begging for generations, and no one can truly claim to be the inventor of the idea. The man who has been able to evolve a practical, workable machine from the mass of ideas, suggestions, and requisitions of the many Government departments concerned is the man to whom the whole credit is due. Why has this credit been withheld?"

#### A COVENTRY MILITARY MEDALLIST.

GNR. W. LEE, of the Motor Machine Gun Service, who was one of the original No. 5 Battery recruited through *The Motor Cycle* exactly two years ago, and who has been serving in France for upwards of twenty months, has been awarded the Military Medal for gallantry and devotion to duty in action.

Five other members of the M.G.C. have recently received similar distinction.

#### "THE MOTOR CYCLE" IN FRANCE.

CPL. W. C. P., writing on behalf of a number of Despatch Riders in France, challenges the statement of a D.R. in the issue of the 12th inst., that a certain French agent charges the average price of 1 fr. 20 centimes, and even goes to the extent of 2 frs. 50 centimes for copies of *The Motor Cycle*. The latest writer considers that the statement is an exaggeration. All the men of his Signal Section have never failed buying this journal for a sum not over 30 centimes, the average price being about 25 centimes. He points out that the journal may be bought from the enterprising *garçon*, just behind the line, for the sum of 30 centimes.

We learn that Lt. S. A. Rowlandson, who, by the way, is to be married shortly, is now attached to the Heavy Section, M.G.C.

## A UNIQUE TROUSER GUARD.

THERE are quite a number of trouser guards in use on single-cylinder motor cycles, but we have seen no design, with the exception of the one we are about to describe, which is arranged so that the guard collects air and deflects it upon the valve ports, a region in which cool air is beneficial. The inventor, Mr. M. Wright, Deane House, Chilton, Ferryhill, Durham, has produced a shield which may well be called *multum in parvo*, acting as it does as trouser guard, valve port cooler, and with still a third object of conveying warm air to the extra air inlet of the carburetter. Mr. Wright's machine is a Triumph, and the three-in-one accessory which we illustrate is intended for that make and machines

A trouser guard, air deflector, and warm air collector combined.

of similar construction. It was only recently that we dealt with the desirability of heating carburetters on motor cycles, and a great many motor cyclists have found that by warming the air entering the extra air supply, beneficial

running results are obtained. As proof of the fact that the air is really warm at the point where it enters the carburetter, a rough model of this deflector was shown to us, which had been used on a Triumph, the back end of which had had the paint scorched by reason of the heat of the air impinging on the end of the guard. To those who find the need of a trouser guard for the valve ports, this little accessory is bound to appeal, for, as we have pointed out, it not only protects the rider's trousers, but at the same time performs two other useful purposes.

The three-in-one accessory described on this page.

## WAR WORKERS IN A PAPERCHASE.

LAST week-end members of the Daimler Motor Cycle Club, holders of War Service badges, held a paperchase over a course of approximately fifty miles. A start was made from the outskirts of Coventry in fine autumn weather, and a liberal trail of *The Motor Cycle* clippings, laid by Mr. D. F. Heather from a B.S.A. sidecar, accompanied by Mr. Peters on an 8 h.p. Zenith, enabled the competitors

to follow without difficulty—that is if the village yokels had not been tempted to practise a little mischievousness. Round hairpins, along narrow lanes, over the Fosseway, and twirling about for over twenty miles, led to the climb from Warmington village across the main road, which kept the riders busy, then doubling back to the Banbury Road. The latter town was skirted, and after more lanes and bylanes had led through beautiful old-world villages, the Daventry Road was reached. In some of these villages the village youth had collected all the paper obtainable and laid false trails at forked roads—the competitors did not mind, it added to the fun. The speeds to be averaged had been drawn for at the start, and at the finish, on the summit of Newnham Hill, near Daventry, it was found that A. Johnson (driving a 6 h.p. Zenith sidecar, formerly owned by E. B. Ware) had ridden nearest to time, being but 1m. 44s. out in his reckoning. The speed he had drawn was 19.8 m.p.h.

No doubt this sixty-mile trip in the crisp air of a lovely autumn day was the means of many jaded workers resuming with renewed vigour their efforts in the Great Task.

## THE NEW LIGHTING ORDERS.

On his way home on Monday last, the first day of the new lighting regulations, a member of our staff noted the following between the hours of six and seven: Two pedal cycles entirely without lights, one pedal cycle with a glaring acetylene head light, one car with a single light in front, and one led horse with no light whatsoever. So far the new regulations seem to have been more honoured in the breach than in the observance.

"OUR DAY." Every patriot succumbed to the persuasion of the pretty saleswomen, motor cyclist officers in khaki not escaping their appeals. Both the machines shown are Douglases.

# RACING ON THE BED OF A LAKE.

An Account of a Motor Cycle Meeting held at Kalgoorlie in Western Australia.

A TEN MILE RACE ON THE DRIED BED OF A LAKE.

A Sunbeam leading in a fine race held on the bed of Lake Perkolilli, Western Australia.

THE Goldfields Motor Club held their eighth motor "picnic" on September 3rd last. An interesting fact in connection with the event is that the members used as their "Brooklands" the bed of the dried up Lake Perkolilli. It makes a capital track in the dry season, and on this occasion, being favoured with fair weather, good racing was witnessed. British motor cycles were well represented, among them being the Douglas, Triumph, Sunbeam, Singer, and Royal Ruby.

Fast times were put up by several riders, and the following are the results:

#### FOUR MILE OPEN HANDICAP.

1. F. Thornton (5 Indian), 40s.
2. A. E. Pike (3½ Triumph), 40s.
3. G. Bird (7-9 Indian), scr.

The winner's time was 5m. 46½s.

#### 2½ H.P. AND UNDER, FOUR MILES.

1. W. Guille (2¾ Douglas), scr.
2. — Bowlin (2½ Royal Ruby), 40s.
3. L. Pilkington (2¾ Sunbeam), 40s.

The winner's time was 8m. 15s.

#### 3½ H.P. AND OVER, FOUR MILES.

1. G. Bird (7-9 Indian), scr.
2. A. E. Pike (3½ Triumph), 35s.
3. J. Elsbury (3½ Sunbeam), 25s.

The winner's time was 4m. 36½s.

In the Ten Miles Open Handicap G. Bird won, on his 7-9 h.p. Indian, covering the distance in 12m. 4s., equalling a speed of 49.72 m.p.h. The Final Handicap was won by F. Thornton, on his 5 h.p. Indian, in 7m. 22s.

The proceeds from the meeting went in aid of the Patriotic Fund.

The competitors gathering for the start of the four mile race for 3½ h.p. machines. Sunbeams, Singers, and Triumphs are to be observed.

## ADJUSTING GEAR CONTROLS.

WE all know that a motor cycle sometimes sets us to tackle jobs entailing a disturbance of the main rod from the gear lever to the gear box fork, and that manufacturers offer us no assistance in the readjustment of the parts. In some cases it is a simple matter, *e.g.*, when the gear box is so wide that there is an appreciable motion of the external lever attached to the striking fork between each pair of gears, when there are no pieces of spring steel in the connection, and when all the details of the control are accessible. The other day a new three-speeder was delivered to me, one where only first and second gears were available. I found that (a) if all parts were disconnected, it was excessively difficult to "feel" the

three gear positions by waggling the small lever on top of the gear box, as in a narrow gear box the clearances are almost infinitesimal; (b) there were three light springy parts in the control couplings, which quite upset any attempt to work by the lever on the gear box; (c) the control couplings were mostly situated under the crank case, or behind the external flywheel, or in other frightfully inaccessible places, so that if a trial adjustment suggested an alteration of, say, 1/16 in., it was intensely difficult to make the correction. I have now made six attempts to adjust that rod, and not one of them has provided me with more than two gears—sometimes I get first and second, sometimes second and third, but never all three.—ROAD RIDER.

The Editor does not hold himself responsible for the opinions of his correspondents.  
All letters should be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

#### Overheated Sparking Plugs.

Sir,—I notice with interest a letter from a Mr. R. J. Cosh, in your issue of October 19th, who rides a Brough and has plug trouble. I also ride one, and have had a lot of trouble. I have tried all well-known makes, giving up to 7s. 6d. each for them, but always had the same trouble. I recently wrote to the Sphinx Manufacturing Co. and told them my troubles, and they sent me a pair of their special two-stroke plugs at 3s. 6d. each. They seem to have solved the difficulty, for they have now been running without trouble for over four months, this with liberal engine lubrication and high speeds. As far as I can judge, these plugs are not on the market, but can be purchased direct from the makers.

I hope this will help to solve the difficulty. The usual disclaimer.

LAWRENCE CLAYTON (Capt.).

#### Dixie Magnets.

Sir,—*Re* the little paragraph which appears in *The Motor Cycle* referring to "Goods Made in Germany." Has nobody yet pointed out that the Horseshoe magnets of the Dixie magneto are made in Germany? I stripped a Dixie fitted to a 1915 Calthorpe some few weeks ago and found, to my disgust, that on the inside of the magnets was stamped "Germany."

W. C. JOHNSON (Lt.), R.N.

We submitted a copy of this letter to the American Supplies Co., Ltd., the distributors of the Dixie magneto in this country, who reply as follows:

[Copy.]

"Your correspondent is quite in error. He is referring to a Dixie magneto that is fitted to a 1915 motor cycle, and undoubtedly the material used in the manufacture of this magneto was purchased by our works in America during the year 1914. At this time, before the war, we did purchase some of the magnets used in the manufacture of the Dixie magneto from the American representative of a German firm. Since the beginning of the war, however, this was discontinued, and the magnets now used in the Dixie magneto are entirely of American manufacture; in fact, this statement applies to the magneto throughout. It is entirely of American manufacture, and we have entirely satisfied the Government Departments, whom we are supplying with these, on this score.

"AMERICAN SUPPLIES CO., LTD.,

"H. J. Hinley, Manager."

#### Will the Single-cylinder Survive?

Sir,—With "Road Rider's" contention that the single-cylinder "bns" of 500 c.c. is on its last lap, I disagree. I am of opinion that, while there are on the market such machines as the  $3\frac{1}{2}$  h.p. Rudge (Multi), Triumph, Norton, Sunbeam, etc., in company with, not necessarily a gear box, but such devices as multi-gear, Philipson pulley, and, not forgetting the Zenith Gradua, the single-cylinder has little to fear. For the man who wants utmost reliability, with simplicity of cleaning and repairs, the single is "IT," and, I have every reason to believe, will remain so.

L. W. E. HURSLEY.

Sir,—I have been very interested by recent letters in your paper respecting the "Survival of the Single-cylinder Machine," and its merits as compared with twin-cylinder machines. "Engineer" points out that a new class of

former car owners has arisen to whom the single is a monstrosity, and who would prefer not to motor at all than endure its horrible faults. This has not been at all my experience. I began motoring some ten years ago with a single-cylinder, single-gear machine, and got a good deal of pleasure out of it, although I found it very inconvenient in traffic and for climbing bad hills in winter. Since then I have driven many makes of cars of every horse power, but on the outbreak of war sold my light car and subsequently bought a  $3\frac{1}{2}$  h.p. Sunbeam and side-car. This machine has proved remarkably satisfactory and is a pleasure to handle under any circumstances. With ordinary careful attention it has proved perfectly reliable, which is a great factor to anyone who has not unlimited time at his disposal for constantly tuning up. It is very comfortable to drive, quite fast enough for ordinary touring, and in traffic will tick along at a very slow speed without a sign of labouring. The twin-cylinder is no doubt very pleasant to drive, *provided* it is in perfect trim, but it frequently suffers from unequal firing of the two cylinders, as well as from unequal lubrication—both faults which are not easy to rectify, and which must have an appreciable effect on its balance.

In conclusion, therefore, as a car driver, I must say that I am perfectly satisfied with the reliability, economy, power, and, bearing always in mind that it is a single-cylinder, with the flexibility of my Sunbeam combination, which is infinitely more flexible than an 8 h.p. single-cylinder car I owned about eight years ago.

W.R.Y.

Sir,—The various letters *re* the survival of the single-cylinder have been read with interest, and I cannot but think that in some instances the harsh criticisms have been dictated by prejudice or inexperience rather than by a true knowledge of facts, or it is possible the writers have been unfortunate in their choice of a single-cylinder machine, or unhappy in their methods of driving, otherwise there would certainly be more, or less, than the wholesale condemnation of what is probably the most mechanically and thermally efficient type of engine in use to-day.

That there are advantages to be found in the use of two cylinders (particularly if horizontally opposed) admits of no argument, but the same may be said of the use of a single-cylinder, yet the champions of the twin generally appear adverse to give the humble single credit for any one redeeming feature. So far as sheer speed goes, the single has generally proved itself the equal, if not the superior, of the twin of equal capacity. Neither the usual V twin nor single can be perfectly balanced, but the difference in vibration, or absence of vibration, of a good single and V twin is negligible (frequently unnoticeable), and I have more than once heard pronouncements in favour of the single on this score. This is opposed to correct theory, and is merely evidence that, as a type, the single is most advanced. The notion that a single is uncomfortable or unpleasant to drive may be dismissed at once; this is borne out by numerous riders of all ages.

I believe, in the matter of economical fuel consumption, the average single is ahead of any type of twin. It would be interesting to learn the usual mileage per gallon of various 500 c.c. twins as compared with singles of the same c.c., both solo and with passenger, particularly during winter riding.

Comparisons of speed, power, or acceleration, with decisions in favour of the twin, are most frequently made by the owners of *big* twins against presumably 500 c.c.

# Safety and Speed go with Bates Tyres

They not only mean economy in petrol, but they stand the toughest of tests, because they are the products of a British firm whose chief aim has been to place upon the market the best motor cycle tyre that could be made. Moreover, the increased output has made it possible, in spite of higher cost of materials, to reduce prices.

LOSE NO TIME IN WRITING FOR OUR ILLUSTRATED PRICE LIST.

Here is the enthusiastic testimony of a government official in Australia :

"On the advice of a friend I had Bates Tyres fitted to my new mount. The machine has now been used for 16 months and the tyres are a treat to see. In future I will see that my machines are always equipped with your excellent tyres."

## A NEW M.C. COAT.

It is essential that you should protect yourself against the vagaries of the weather.

Dunhills' New M.C. Coat will prove an excellent weatherproof for your tour.

It is made of proofed twill with a lining of oil cambric, and is thus impervious to any weather.

A detachable fleece lining is very fashionable with many motor cyclists. It is most useful during the climatic changes at this period of the year.

singles; such comparisons will not greatly help us. 7 h.p., whether developed by a single or multi-cylinders, should score on these counts every time; but if equal capacities be compared, then I venture to say the simple single will give an astonishingly good account of itself to its critics. Perfection is not claimed, there being room for improvement in this, as in all types, but there is a place for it in the scheme of things—a big place—and it is impossible to say that it will not occupy a bigger place than other types in the future, as it certainly does to-day, and purely on account of its intrinsic merits of simplicity, economy of upkeep, and general all-round efficiency. It is at present the utility mount *par excellence*.

I have also read "Ixion" on single v. twin. I regularly turn to his articles with interest and pleasure, but my faith in the soundness of his deductions or decisions received a severe shock when I read that he would give up motor cycling altogether rather than ride a single or a heavy twin, which statement will be taken to mean that, in his opinion, such are unfit to ride. Surely "Ixion" cannot mean this, or has his keenness for the road and motor cycling interests so far deteriorated? I hope not.

JAS. L. NORTON.

### The Boycott of German Goods.

Sir,—It is, perhaps, almost unnecessary to say that the "British Empire Union" is in the strongest possible sympathy with the position taken up by "Britisher." The Union has adopted as its watchword Mr. Hughes's stirring appeal for the entire eradication throughout the Empire of German influence. How extensive and how dangerous that influence has been, not only in the commercial and industrial, but in the political and financial sphere is not, I fear, even yet fully realised by the nation. Our national independence has been determinedly and deliberately undermined; and we have not yet succeeded in breaking through the toils in which we have been involved by the treacherous ingenuity of the Germans.

Those who, like Mr. Pritchard, object to our adopting a policy of commercial defence in the future, have probably never examined the trade methods of the Germans. Everywhere they worked on a deliberate plan and with official assistance to weaken the political independence of the countries with which they traded, and so by a system of "peaceful penetration," to pave the way for German military aggression.

"Never Again!" consequently has become the motto of all who care for the strength, safety, and independence of the British Empire. Never again shall it be placed in such a position of peril as that from which it has but just escaped. Never again shall we in our open-handed carelessness and generosity provide Germany with huge profits with which to pay for the armaments she has directed against us.

"Britisher" suggests a special union or league of motor manufacturers and owners to boycott German goods. I could wish that he and those who think with him, could see their way to join either as a separate organised body, or as individuals, our British Empire Union. There is, I fear, some danger of a large amount of patriotic enthusiasm being dissipated among a plethora of leagues and societies.

The British Empire Union is a non-party organisation. Its policy is directed to the eradication of German influence, and the adoption by this country of a national and imperial commercial policy, that shall unite more closely the Dominions with the Motherland, and the British Empire with her Allies. As a first step it is urging on the Government the importance of giving immediate effect to the resolutions adopted at the Paris Conference.

I shall be most happy to send full particulars of the work of the Union to "Britisher" and any of your readers who may be interested.

F. C. CULLING-CARR.

Hon. Secretary, The British Empire Union.

346, Strand, London, W.C.

### American Motor Cycles.

Sir,—May I fill a few lines of your splendid journal with one or two words anent sundry points raised by various writers in the "Letters to the Editor" columns?

1. I have just returned from nearly two years as a motor machine gunner at the Front, and not having kept my eyes shut, can endorse Capt. Lindsay's admirable letters by

observation as well as by personal experience. In your most recent number (October 19th) his remarks are very much to the point. The excellent workmanship of the most famous British motor cycle does not always resist the systematic and thorough shaking to which French roads subject despatch riders' machines. Strip metal gearshifters, "twiddle" knick-knacks, and such features—all too common on Uncle Sam's productions—do not settle down to live their appointed lives where they were put!

2. Personally, I am inclined to think that the fault with American magnetos lies not with the design so much as with the too thin coating of shellac with which the vitals are protected.

3. To my mind, "Oleofend's" words on "Engine Noises" contain more than a grain of probability. Experts kindly step forward!

4. In consequence of "Ixion's" article on the sticking of rocking arms in magnetos, may I, in no other capacity than that of a satisfied user, bring to his notice the remarkably sturdy, simple, and ingenious contact breaker on the C.A.V. magnetos? I have yet to find one fail to "break," and hardly see, in fact, how they could do so.

5. Finally, may I recommend Mr. Robert J. Cosh to give any or all of the following plugs a trial on his mount: The Splittorf "Commonsense"; any of the Lodge mica insulated plugs, and particularly the three-point waterproof model, which admirably suits the exposed front cylinder position on "flat" twins or the K.L.G. (Lee-Guinness). This latter is difficult to obtain though, and costs a lot—12s. or thereabouts if I remember rightly.

These plugs have rendered me yeoman service both in England on a variety of horizontally opposed twins and (the first two) in France on Douglas machines. With them I have never had the trouble your correspondent complains of, all my cases of loosening bodies and "blowing out" having occurred with porcelain insulated plugs, such as the Bosch.

Cambridge.

AN EMMA-EMMA GURK, M.M.G.S.

### Petrol Permits Galore!

Sir,—On October 5th you published a note from me in which I set out that after making an application for a petrol licence and writing three letters and waiting six weeks I had received three allotments in eight days. I obtained a licence on September 19th, and returned the other two allotment notes—one direct to the Petrol Control Committee and one through the A.A. and M.U. To my surprise, on the 8th inst. I received a letter from the Petrol Control Committee acknowledging one of my letters, dated August 17th, and enclosing me a petrol form No. 1 to enable me to make a return. On the 10th inst. I received another letter from the committee referring to one of my letters, dated July 31st, informing me it had not been possible to trace my return, "if any made," and requesting me to fill up a schedule on the end of the letter. The attentions of the Petrol Control Committee are now getting embarrassing! CR 2454.

A. F. Dodge, a veteran motor cyclist, who uses his Rudge-Multi exclusively for business purposes. He is out every week-end with his camera, wet or fine, riding on the most appalling roads, and has the reputation of never stopping for weather.

### Difficulty in Starting.

Sir,—I have fitted up my 6 h.p. New Hudson in the same manner as described by F. A. Holward in your September 14th number, but I cannot get my machine to start on the petrol jet. I have a Binks carburetter. Perhaps some of your readers could suggest the cause of the failure.

BRIGHTONIAN.

### The Scott Sociable.

Sir,—My view is that the sociable is a perfectly natural development, as many home-made "imitations," earlier than the Scott, will show. Its success does not therefore depend, as stated by "Ixion," on its selling price second-hand, as compared with other specialities. It will always be found that the best "sellers" second-hand are the most reliable and serviceable machines, and the Scott Sociable has to prove itself in use. That does not affect the wisdom of extending the front of the sidecar round the cycle so as to shelter the driver and make the combination look complete, and I wonder the Enfield Co. and other "combine" concerns have not done it before. Only in the cases of machines not designed to pull sidecars are the present hung-on carriers justifiable. Looking at the Scott chassis we can see that it is a short cut to the next stage, and by comparison the previous best, the Enfield combination, seems a long way round, and the result not so good. The pictures show the Scott to be clean, mechanical, and workmanlike, and it should greatly influence sidecar design. R. COLLYER.

Sir,—I was very interested to read Mr. Burnard's criticism of the Scott Sociable and Mr. Scott's reply in your issue of August 17th, just to hand, as although I was extremely favourably impressed with this machine from the mechanical point of view when I read the first report in an earlier issue, yet the same thought struck me that Mr. Scott would find himself up against considerable opposition on account of its appearance. Before the war I was connected with the light car business, and I know only too well how often superlative mechanical merit is overlooked in favour of appearance, especially by the fair sex.

I agree with Mr. Scott that Mr. Burnard's letter is rather sweeping in arbitrarily dismissing a machine which obviously is the result of the most careful thought and scientific ingenuity of an engineer with such a high reputation as Mr. Scott; but I must agree with Mr. Burnard that the appearance is distinctly against the machine. The obvious comparison with the sidecar is, in my opinion, not a true criterion, as the very fact of its being so far removed from the sidecar combination brings it for purposes of comparison into the light car class, where the lop-sided appearance is undoubtedly against it. The motor cycle and sidecar no one attempts to call a symmetrical affair; but a motor cycle with a sidecar attached is accepted as such, whereas (and this is my point) I fear the Scott will not be classed from point of view of appearance as an elaborated motor cycle and sidecar. The price of this machine is an interesting point on which I think no information has yet been forthcoming. If it compares favourably with the best sidecar combinations; that is to say, comes within £100, I predict that the objection against its appearance will vanish, and it should have a large sale. I for one shall be very tempted after the war.

Wishing your paper, which I eagerly look forward to in my mail, continued success,

Egypt.

H. LAMBERT (Sec.-Lt.), A.S.C., M.T.

Sir,—I join with those of your readers who consider that the Scott Sociable (admirable as it may be in some respects) is an unfortunate departure. It seems to me that the designer has gone off at a tangent from the natural curve of evolution. I well remember the days of old when I rode a Singer Apollo tricycle, and later on several Singer "straight-steerers." These machines kept to the true line of progress, and the final type of "straight-steerer" was the approved tricycle of the present day. There were contemporary types on the road—some were not unlike the Scott design; but they all disappeared before the superior merits of the normal tricycle. It is evident, therefore, that the equilateral or isosceles triangle has advantages over the right-angled variety; it is the natural tripod, in fact. It follows that

the Morgan has a more stable as well as a more beautiful basis than the Scott. But neither will stand comparison with a smart four-wheeler.

The sidecar does not come into the question. It is merely an addition to a powerful and highly developed motor cycle. I drive a Royal Enfield combination myself, and I consider that (as it obviously does not pretend to be more than a mere attachment) it is better looking than the Scott Sociable, or the Morgan for that matter.

Then in nature the highest types are bipeds and quadrupeds, and in vehicles the two-wheeled and four-wheeled types have stood the test of time, and reign triumphantly. Surely the same laws apply to cycle cars. If Mr. Scott will only apply his talent to the designing of a smart four-wheeler he will be glad to forget his latest pathological monstrosity. It is surely illogical to design an elaborate cycle car on the lines of a mere makeshift.

J. A. STEWART.

### Straining Heavy Fuels.

Sir,—I have now run my machine nearly 2,000 miles on paraffin and have found that a fluffy substance collects in the tap, preventing the fuel from flowing. This is the result of having to buy the paraffin from a local shop which cannot supply a strainer. Could not machines be fitted with a strainer which fits into the opening of the tank and is easily detachable to facilitate cleaning? I have found it necessary to drain the crank case of oil every 200 miles.

R.E.C.

[Many machines are already so fitted.—Ed.]

### Impressions of a Two-stroke.

Sir,—Perhaps my early experiences may be interesting to women who so far have not become acquainted with this valuable and health-giving pastime. I used to look upon the motor cycle with some superstition and dread, but recently I purchased a single-speed 2½ h.p. two-stroke Dreadnought, and after about half an hour's practice with the different controls, riding the machine on the quiet country roads in the vicinity of my home, I soon became quite an exponent of the art.

My first ride of any note was about a week after, when I rode from my home to Whitby. My first stop was at Malton, where I pulled up and had some refreshment, after which I passed along again *via* Pickering to Levensham, a delightful little hamlet on the border of the moors. I finished my journey to Whitby without mishap, which goes to prove the efficiency of the present-day model. So far I have only had one accident, and that was when I was carrying a friend on the back. I had the impression of the hedge getting closer as I was negotiating a corner. The result was that my friend was forced to dismount rather unceremoniously! whilst I, fortunately, managed to keep my balance.

I have now had my machine just over twelve months, and am beginning to feel quite a veteran. My advice to all who so far have never tried a motor cycle is to obtain one, and I feel sure they will be recompensed by many hours of pleasure. My chief difficulties now are the restrictions on petrol, and I am considering the employment of some substitute. I can, however, do about 100 m.p.g., so that I am still "carrying on," to a certain extent on petrol.

(Miss) A. M. LAMB.

Miss A. M. Lamb with her two-stroke Dreadnought. (See letter on this page.)

## HENDERSON SIDECARS.

# MISCELLANEOUS ADVERTISEMENTS.

## PRICES.

**ADVERTISEMENTS** in these columns—First 12 words or less 1/6, and 3d. for every two words after. Each paragraph is charged separately. Name and address must be counted. Series discounts and special terms to regular trade advertisers will be quoted on application.

Postal Orders sent in payment for advertisements should be made payable to **ILIFFE & SONS Ltd., and crossed & Co.**

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor St., E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

## NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charge. Only the number will appear in the advertisement. All replies should be addressed, "No. 000, c/o 'The Motor Cycle,' 20, Tudor Street, E.C."

## DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged, when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

## SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the letter as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

## DEFENCE OF THE REALM ACT

Under the provisions of the above Act, advertisers requiring workmen, and whose business consists wholly or mainly of engineering or the productions of munitions of war, or substances required for the production thereof, and whose works are situated within 30 miles of London, must include in every such advertisement the words, "No person resident more than 10 miles away, or already engaged on Government work, will be engaged."

Advertisers whose works are situated more than 30 miles from London can only have their announcements inserted, with the approval of the Board of Trade, who will allocate to each advertisement a box number, and collect and distribute to the advertiser all replies received. The necessary forms of application can be obtained from any Labour Exchange or from the offices of this paper, and each advertisement must contain a clear reference to the effect that no person already engaged on Government work need apply.

## MOTOR CYCLES FOR SALE.

## Mudguarding.

**M**OTOR cycles are probably better protected from mud now than they ever have been before, but there still remains a good deal to be done. Before doctors and professional men will take to a motor cycle for continuous work it must be rendered perfectly clean, and so be unnecessary for them to wear overalls. Most of the mud comes from the front mudguard. This does not stop the mud from flying from the edges of the side wings all over the machine and rider and, when a sidecar is used, into the face of the passenger. The only remedy appears to be a vertical guard or pair of guards extending from the head to the bottom of the crank case. This is, of course, an old idea, but it would be almost a novelty to find it incorporated as a standard by a manufacturer. To extend the guard further and make it act as an undershield would also be an advantage, as it would protect the working parts from mud. Attempts of this kind have, we know, been made, but only in a half-hearted fashion. We have fixed up a temporary device of this kind on our present sidecar combination, and are fully able to appreciate its worth. It does not come up quite high enough to protect the knees, but it affords a great deal of protection to the driver, and being extended as an undershield keeps a good deal of mud off both crank case and chain. With the mudguarding of the back wheel there is not so much fault to find. Such attempts as have been made by manufacturers to supplement the mudguarding by a similar device to that which we have referred, err chiefly because the auxiliary guard is not high enough, and so does not sufficiently protect the rider's nether limbs. It is most essential that the professional and business rider should be able to keep clean, while it cannot be other than an advantage that such important exposed working parts as chains and tappets should be protected from flying mud and grit. The only possible objection is that the wind

resistance of the machine is increased, an objection which is hardly a valid one, as the width of the guards is barely in excess of that of the rider's legs.

## Spring Frame Progress.

**A**T regular intervals we have directed attention to the desirability of springing the rear portion of the frame of motor cycles. There is growing support for our campaign, and efforts to solve the problem of the efficiently sprung motor cycle proceed from all quarters, and it is not too much to say that further headway would have been made but for the temporary cessation of activities due to war requirements. Those readers interested in the subject will be glad to know that since our campaign was launched something like eighty-two designs have been evolved in an attempt to meet the demand. Amateurs and experts alike have contributed their efforts. Many a man has entered the arena, struck by the simple nature of the demand; a good many have gone further, and marvelled that makers should be so tardy in fulfilling such an obviously reasonable and crying need. Such have, sooner or later, received their disillusionment, for, simple as it may appear at first sight, the spring frame problem is a real one. There are a good many intricate points which crop up even in plotting out a design on paper. The perfect spring frame will come—of that we are confident. More and more makers are concentrating attention on this all-important subject, and that very fact means that the concentration of brains in the endeavour to produce the ideal frame will have good results, and the perfect design will be evolved ere long. After the war it is the successful solution of such problems which will enable manufacturers to command the motor cycle field, and the sooner that all and sundry give close attention to the subject the better it will be for the pastime and the trade in general.

## HEATING THE CARBURETTER.

### A Simple Addition to an Amac Carburetter.

IN our issue of September 28th we reproduced a photograph of Major (now Lieutenant-Colonel) D. F. Nicholl, R.A., D.S.O., on his 4 h.p. Bradbury and sidecar, which he is running on a petrol substitute. He has made a very great improvement by taking in the air warm, which is carried out by quite an ingenious device, of which we give a description.

The tin should be cut to this shape for the rough model.

Some insulating tape. A plate was cut according to the shape shown, and this was then put over the carburetter from the top, the aperture A fitting round the

barrel, the throttle and air slide, etc., having been removed to allow it to go on. The plate was then bent round the induction pipe, the semi-circular indentations CC fitting closely together round the jet chamber, while the slot B was left to accommodate the squared end of the screw of the locking ring on the induction pipe. The edges DDDD of the plate just meet underneath, and the whole is held in position and made air-tight by means

The rough model of hot air jacket described by Col. Nicholl.

The more elaborate jacket finished in brass and secured by small nuts and bolts.

of insulating tape. It is fitted to an Amac carburetter, with which Col. Nicholl is extremely pleased. Though not neat in this particular form it works very well, the air being drawn in from the right-hand side of the illustration, the mouth of the intake being close up against the cylinder, of which it comes within a  $\frac{1}{4}$  in.

In a subsequent letter he says: "I have now bought a piece of sheet brass, price 8d., and half a dozen B.A. small threads and nuts, price 3d., of which I

shall probably only use three or four at the outside, and I am going to make up the gadget in a workmanlike form."

### The Device on the Road.

As regards the working of the device, he reports that "all the air is drawn from the open end within a  $\frac{1}{4}$  in. from the passes down the annular piece between the carburetter body and the jacket, with the result that when running the whole carburetter is warmed to such an extent that the dust cap which screws over the air intake on the Amac, and which is exposed to the air at its rear surface, is actually hot to the touch all the time. The vaporising is so much improved that I have been able to reduce the size of the control jet considerably, and yet use the air lever to the same extent as before. I am going to reduce the jet still further. The general running and pulling at slow speeds are much improved. The merit of the thing lies in its sweet simplicity and its negligible cost. Another great advantage is that the device involves no alteration whatever to the carburetter or engine, and leaves the former just as accessible as before."

The shape for making the highly finished jacket.

### THE PETROL POSITION.

IT is especially gratifying to know that motor cyclists will be able in future to have double the amount of petrol allotted to them that they have had in the past. Motor cyclists are not debarred from applying for the fresh licences after, as they may put in their claims at any subsequent date, at any rate up to the end of November.

Licences will not be allotted for a less time than five months, so it is no good demanding a licence for a shorter period. For those who have no licence already new forms will be shortly issued, some of which may be obtained on applying to this office. In the event of a motor cyclist not purchasing the full amount to which he is entitled, he may claim the rebate at the end of the period for which the licence has been in force. We are still assisting readers to obtain supplies, and are glad to give all information possible on the subject. Readers who have sent postal orders to the Petrol Control Committee for their licences, and have not received them, should, when making

enquiry, quote the number of these postal orders, and we shall be pleased to do our best to assist them.

Sgt. R. Clough's variable jet carburetter.

### A VARIABLE JET CARBURETTER.

THE desirability of controlling the jet orifice of a carburetter is so obvious that it needs little demonstration. Two-stroke engines in particular are very sensitive to jet, as too large a jet tends to four-stroke, while too small a jet renders starting difficult and hill-climbing power insufficient. The carburetter illustrated herewith is designed to overcome this difficulty, but in this case the supply of petrol to the jet is controlled by a tap placed between the jet and the float chamber; this is operated from the handlebar by means of a Bowden wire. The hole through the cock is not made truly circular, but is cut away in such a manner that very gradual adjustment can be obtained. It is the invention of Sgt. Robert Clough, 51 Fort Camden, Crosshaven, Cork. Patent No. 13,408, 1915. There have in the past been many devices described in these columns, the object of which was effectively to regulate the quantity of spirit issuing from the jet.

### Number Three Petrol.

I should be very interested to hear from some chemist how the grade of spirit now being sold as No. 3 compares with the quality of Taxibus and Crown as marketed before the war. Several of my correspondents complain that the quality of petrol has deteriorated lately as rapidly as the price has towered, one rider being driven to abandon a system of dilution with paraffin which he has employed for years past. I have used No. 3 spirit on some of my motors for years past, finding it perfectly satisfactory when the carburetter was reset to suit it. But of late I have been bothered to death by a hill-climbing knock, which I could not account for, and last week I was struck by its resemblance to the hill-climbing knock which one gets from petrol substitutes until all the adjustments and heating have been adequately corrected. So I got hold of some No. 1 petrol of one of the lesser-known brands and tried a tankful of it; hey presto, the knock disappeared!

### More about Plugs.

An engineer engaged in aeroplane work is of the opinion that a British plug is the best for hot engines. He has to tend an engine with a compression of close on ten atmospheres. This engine runs continuously at 2,000 r.p.m. (some engine, eh?), and nothing will stand up in it but the K.L.G., a twelve-and-sixpenny plug, originally designed by Kenelm Lee Guinness for the Sunbeam racing cars. Ordinary plugs, says my correspondent, droop like a lily after two minutes in this engine, and their steatite insulators run and hang down like stalactites! This ingenious gentleman offers two tips for the preservation of a jealously guarded store of Bosch single points. The first is to slacken back the two lock nuts above the insulator when a super-efficient engine is being revved; this affords more room for expansion, and avoids a cracked steatite. The other is to use an oxy-acetylene blowpipe for cleansing carbonised samples. Warm the business end of the plug to a dull red, moving the flame about to prevent welding; when the plug is dull red, shut off the acetylene and continue with neat oxygen, which "cylcleans" the carbon away. I have not tried either of these tips, and cannot accept responsibility.

### Hard on Us.

The lighting restrictions are peculiarly hard on motor bicyclists, for the simple reason that we cannot slow down as conveniently as a car when vision is uncertain. Like the car drivers, we have throttles, clutches, and brakes, but our engines are less governable and more inclined to race and roar, and our machine wants more balancing as the pace falls off. When a car driver thinks he has sighted brass rabbits or white elephants, or any other of the weird phantoms

conjured up by dim light faintly diluting the gloom, he has merely to put his outside pedals hard down and peer. The unlucky motor cyclist has to curb his engine down to 150 r.p.m. without stopping it, apply his brake and clutch pedal with considerable force, and simultaneously balance his machine and peer into the murk.

### Inaccessibility, Thy Name is —!

Tyro Juggins, Esq., was proudly showing off his new machine to a circle of local enthusiasts, when the shabby veteran on the outskirts of the mob asked how the gear box was lubricated. Mr. T. Juggins had got the book of the words by heart before receiving delivery, and mentioned a plug in the top of the gear case. The veteran meekly asked to have the plug pointed out to him. After considerable search the plug was discovered to be situated on the forward curve of the gear box roof, deadlocked in front by the crank case, at the back by the gear box itself, above by the magneto, and enfiladed from both flanks by the steel brackets supporting the gear box and the magneto. In other words, before grease could be injected, it was necessary to remove the belt, two chains, various sprockets and pulleys, and, last but not least, the magneto. As a member of the mob remarked when homeward bound, "That's the worst of those assembled machines made of parts with proprietary gear boxes."

### Back to the Creepy-crawlies.

The approach of wet and mud has sent me back to a creepy-crawly again, to wit, a baby two-stroke—and rather a nice one at that. Mothball my petrol, but the little beasties are unco' slow after the big 'uns. A pal of mine says they are the only sporting mounts left, because, if you take them to really hilly country, you are not always too certain of getting up, and their exhaust reminds you painfully of the old diminuendo, "I-think-I-can, I t-h-i-n-k I can, I fear I can't!" of the old 2¾ h.p. Lincona belt days. Anyhow, my baby is in topping tune just now; slow, but sure, you know. It brought me recently up a two-mile hill, commencing with a fierce pitch of 1 in 6, and on the easier landings it positively accelerated to about twenty miles an hour. The babies have one merit the 1905 abominations never had; they are tolerably easy to restart on a grade; one does not have to go down to the bottom again, or search for a side lane out of which to pick up a new rush. Just give them three yards with nobody in the saddle, and they reach their climbing r.p.m. again. Mine is doing wonders at present, and I think its rejuvenation is largely due to a Sphinx plug, which does not get hot. Mr. Prestwich tells me the plug which stood up best in his tested septette was a Sphinx, and mine seems to be of the true Egyptian brand.

## REAR SPRINGING.

### MORE SPRING FRAME DESIGNS.

**T**HE *Motor Cycle* campaign in favour of spring frame motor cycles will be fresh in our readers' minds. We have for years continually advocated the adoption of spring frames for motor cycles, and have from time to time published articles on the subject, and have illustrated and described many devices that have been the outcome of this campaign. At the present time not many British manufacturers, or, indeed, the manufacturers of any other country,

A novel method of the plunger system of rear spring, the resisting coil extending inside the top tube as far as the steering head. Mr. C. E. Palmer, of Radstock, is the patentee.

have adopted spring frames as a standard, though doubtless they would have been much more common than they are had it not been for the war. Overseas riders are continually demanding spring frames, and if there is still any British maker who has not studied the subject, then we implore him to lose no further time.

#### Many Difficulties to Face.

The design of a spring frame is not by any means the simple matter that some inventors seem to think. There are many difficulties which are not generally recognised, but which soon make themselves manifest when the designs are placed upon the road. All inventors and would-be inventors are strongly advised to read carefully the articles published in *The Motor Cycle* on this subject from time to time, notably those in the issues of July 29th, 1915, and February 3rd, 1916.

A completely sprung frame by Mr. G. E. Rigby, of the firm manufacturing the Royal Ruby motor cycle, consisting of laminated springs, and used both for rear and fore springing of the machine.

#### Essential Points.

In these articles are set out the desiderata of the perfect spring frame, and at the risk of repetition we refer again to some of the principal points. It is obvious that the lateral rigidity must be good or the machine will be decidedly dangerous, especially on slippery roads. Other essential points are, however, less obvious, so much so that they have often been

entirely ignored, e.g., the application of the brake must not throw any extra load upon the springing system, the belt or chain centres must vary as little as possible in their distance from one another, the rise and fall of the machine as it passes over rough surfaces, must not throw undue strains upon the transmission (we have known chains broken from this cause unless a certain amount of clutch slip was allowed),

Another method of adapting leaf springs. They are supported from the lower end of the back bar of the frame, the other end being connected with the back-stays. This system is patented by Mr. S. Thompson, of Bangor.

the tension of the brake rods must not be altered by the springing, and the movable joints must be as few as possible. It should be noted, too, that a bad front fork is much more noticeable when the rear part of a machine is sprung. It is not suggested that this short list is exhaustive, and a perusal of the articles referred to will give many another hint of considerable value. So much by way of preface. Now to describe briefly a few spring frames which have recently come to our notice.

#### The Palmer.

In the Palmer system of suspension the triangulated rear portion of the frame is controlled by a plunger rod, which slides in the top tube. This tube

must be straight, and preferably must slope downwards towards the rear. A strong spring fitted over the plunger rod inside the tube carries the weight of the machine and rider; a light spring takes the rebound, while a short stiff spring is placed in the front part of the tube to relieve the main spring of the last part of very severe shocks. Two flitch plates carrying the toggle arms bear on flat surfaces below the saddle-pillar, prevent any tendency to lateral movement,

## *THE MOST UNIQUE WAR JOURNEY.*

*By Lieut. H. E. JACKSON.*

In this publication Lieut. H. E. Jackson, of the South African Motor Cyclists' Corps, describes how he with 400 men mounted on B.S.A. Motor Bicycles traversed 2,800 miles of enemy country. Many dangers and difficulties were encountered during this, the most arduous journey accomplished by so large a number of motor bicycles. Writing of the dread the natives have of motor cycles he says: "Needless to say the natives have a suspicious dread of the cycles. They call us the young rhinoceros, which is the most ferocious animal here. One of the Ugogo chiefs asked me if the noise the cycle made was because it was angry at having to go at such a speed. They cannot realize any vehicle not having a span of oxen to move it along."

**FOR SOLO AND SIDECAR.**

**Rear Springing.**

and at the same time, by checking the vertical movement to a small extent, eliminate bouncing. The springs are quickly adjustable for different weights, and, being enclosed, are not liable to rust, while they can easily be renewed if required. Another point is that, in the unlikely event of a spring fracture, the frame cannot collapse. The whole arrangement is neat, and can be applied to existing machines without much alteration.

**The Royal Ruby.**

This invention in the name of Mr. G. E. Rigby consists essentially in a combination of laminated springs and upright stays, which are attached above the wheel to some convenient part of the frame by links. The general principle is the same both in the case of the front forks and the rear springing. In place of the ordinary fork blades the steering head terminates in a triangular member, at the rear of which the leaf springs are anchored. From the axle stays extend upwards, which are attached by links to the handle-bar pillar and help to maintain the lateral position of the wheel, but carry no weight. In the rear, the springs are anchored to a stout triangular construction behind the countershaft gear box. The lower members of this extend backwards, and then bend sharply upwards to carry the links supporting the stays. The reason for this rather peculiar shape escapes us; this remark applies also to the front forks.

**The Thompson.**

The rear part of the frame in this device is hinged behind the bottom bracket, above the axle and below the saddle. The weight is carried by laminated springs anchored below the bottom bracket (in the drawing which we reproduce from the patent specification these are apparently upside down—a common error, we find, in patent drawings), and short coil springs which

operate on a plunger carried in an extension of the top tube. This idea is neat, and should prove efficient in practice, but only a road trial can settle this.

**The Allon.**

The Allon is another "live" firm interesting itself in this all-important problem of the motor cycle, and we illustrate the design now actually on the road. The rear part of the frame consists of a double triangle,

An effective design of coiled leaf springs as adopted on the new Allon two-stroke motor cycle.

which is carried in a wide bearing on the back of the countershaft. This is supported below the saddle by two wide springs wound in a spiral. Both the springs and the bearing tend to lateral rigidity, and there are very few joints to wear. The front forks on this machine are the Brampton, which give a double movement. Our remarks, therefore, regarding the front forks of a rear-sprung machine will not apply in this case.

## A Cure for Clutch Slip.

THAT clutches sometimes slip is a truism, and hardly worth repeating but that this fact has led to the production of a clutch which can be locked with dogs if any suspicion of a slip occurs. The clutch itself is of the self-contained cone type, the actuating spring being between the clutch members. There are, however, also dog teeth, which are normally

out of engagement and controlled by a fork, free to slide on the shaft, by means of which the teeth are brought together when required, and the whole clutch locked in a positive engagement. Those of our readers who wish to know more of this device are referred to our sister journal, *The Light Car*, in which a sketch appeared on October 11th.

## An Instructive Experiment.

A READER of *The Motor Cycle*, who writes whilst at sea on board H.M.S. *Diana*, mentions a case where water was injected accidentally into the intake pipe of an oil engine. Instead of stopping it, a decided improvement was immediately noticeable in the running, all smoking and misfiring ceasing, besides a noticeable increase taking place in the revolutions of the engine. He asks if the experiment has ever taken place on a motor cycle of injecting small quantities of water into the intake tube whilst the engine is running, with a view to removing the carbon deposit?

We have frequently heard of the experiment, and

when injection of water takes place there is always a decided difference in the running. The explosions are less fierce, and more like a steam engine. Existing carbon deposits cannot be removed, but if steam is mixed with the gases continuously little or no deposit occurs.

In the case of stationary oil engines adapted to run on paraffin it is quite customary for water to be injected with each change of gas, in order to prevent the unpleasantly harsh knock always associated with the use of this fuel in an internal combustion engine when working under a heavy load.

## NOTES CONCERNING J.A.P. TWIN MOTOR CYCLE ENGINES.

**M**ESSRS. J. A. PRESTWICH and Co. have been manufacturing motor cycle engines longer than most firms, and consequently they have devoted considerable attention to details,

Sectional view of the two cylinders, showing the exhaust valve lifter, the valve stems and springs in section, the adjustable tappets in the right-hand cylinder, and in the left-hand cylinder the piston in section.

and have evolved a particularly fine production. Unlike some makers, they are especially careful to see that the fullest possible information goes out concerning their engines, so that either the private owner of average intelligence or the repairer can obtain such knowledge as will enable him to keep his engine up to the mark.

We have been fortunate enough in obtaining some very fine photographs showing details of these famous engines. Much of the matter has been dealt with previously in these pages, but we offer no apology for referring to it again, as it cannot but be of extreme value to the numerous users of twin-cylinder J.A.P.'s.

### Induction Pipe Unions.

As recently as the issue of October 12th, our contributor, "Ixion," makes reference to the lack of a suitable inlet pipe for twin-cylinder engines. Now the J.A.P. inlet pipe gives a perfectly gas-tight joint. The pipe is a very light casting, and all three leads are turned inside and out. The brass cone A is a sliding fit on the pipe, and the top portion of the nut B is bored tapered to correspond exactly with the cone. In fitting, the nut is first slipped on the pipe and then the cone, the pipe is held in place, the connections are put tightly up against the cylinder, and the nut is screwed up. The result is that the thin edge of the cone is so tightly pressed to the inlet pipe that air is entirely

excluded and a perfect fit is made. This pipe is absolutely interchangeable with other engines of the same make, and is equally suitable if another cylinder is fitted. The whole idea is most ingenious, and does away with the necessity of binding the union nuts with insulating tape.

### Valve Gearing.

The valve gear has been made as simple as possible. There are only two gear wheels, the valves being operated by means of two cams. The exhaust valves are raised by a double cam, which is inserted between two heels on the exhaust rockers. The cast iron guides in which the valve stems work have a series of internally cut grooves, allowing a total clearance of only .02in. These grooves serve to collect the oil which lubricates the

valve stems, and at the same time act as a seal to prevent air leaks past the stem.

While on the subject of valves, the question of timing is one of great interest, in view of the numerous correspondents who write and ask us how best to time their engines. In the case of the J.A.P. the valve timing is a simple matter, as the single cam wheel carries the inlet and exhaust cams and actuates all four valves. When

J.A.P. piston, showing gudgeon pin fixing.

issued from the works the corresponding teeth are indicated with a punch-mark. It should be noted, the pinion has been removed it does not always screw back into the same position in relation to the crank pin, and consequently, when resetting the timing, if any error is found it should be corrected. The accompanying diagram shows the exact moment of opening and closing of the valves,

from which it will be seen that the inlet valve opens at the top of the stroke and closes  $\frac{1}{8}$ in. past the bottom of the stroke, while the exhaust valve opens  $\frac{7}{8}$ in. from the bottom of the stroke, and closes  $\frac{1}{8}$ in. past the top of the stroke. This timing gives the maximum amount of power with a minimum fuel consumption. The dead centre indicated in the diagram represents the top and bottom of the stroke.

### The Magneto Timing.

The magneto is timed so that the points should be just separating when the piston is  $\frac{7}{8}$ in. from the top of the compression stroke with the ignition fully advanced. There are two cams in the contact breaker of the magneto. These are usually numbered 1 and 2 to correspond

Showing the positions of the crank for the opening and closing of the J.A.P. valves. Exhaust on the right, inlet on the left.

with their respective cylinders. In the case of the J.A.P. engine, No. 1 cylinder is the right-hand one when viewing the engine from the pulley side. This is usually the back cylinder when the engine is mounted in the frame.

When an engine is used for cycle car work, the magneto is driven by a bevel. This is the arrangement in use on the

The inlet pipe fitted to the new J.A.P. twin engine.

Section of cylinder and crank case, showing method of lubrication.

Morgan. With this method of transmission the magneto works in a clockwise direction, whereas with the usual chain drive employed on motor bicycles and sidecar combinations an anti-clockwise magneto is fitted.

#### The Big End Bearing.

An excellent outstanding feature of J.A.P. engines is the type of connecting rod employed. The great difficulty with

which designers have had to contend in designing big end bearings is to obtain a sufficient bearing surface with the small amount of area available to withstand the thrust of two powerful cylinders. Messrs. J. A. Prestwich and Co., however, fit a steel bush passing through one side of the fork rod to the other, which is held by being shrunk into position. The centre rod is bushed with phosphor-bronze, and takes its bearing on the outside of the steel bush, which is lined with phosphor-bronze and takes the bearing of the crank pin, so that by this means the maximum bearing surface is obtained, lubrication being ensured by forcing the oil direct to the centre of the crank pin. When replacing the rods, it is necessary to see that the forked rod operates in the front cylinder.

#### Lubrication.

We now come to the interesting question of lubrication, which is carried out in the case of the J.A.P. engine in an effective and ingenious manner, pressure feed being employed to all the main bearings, and, in addition to this, oil is fed directly into the wall of the front cylinder from two sources—one from the pressure system and the other from the apex oil union, which is supplied with lubricant by means of the semi-automatic hand pump. This ensures the front cylinder getting an ample supply.

The pressure is provided by the descending force of the piston. This forces a quantity of oil through a hole at the base of the crank chamber into a passage, and past the non-return valve into a box or reservoir cast upon the exterior of the crank case. The reservoir gives a sufficient head of oil to allow of a continuous flow. The only means of escape is a pipe through which it leaks into a recess under the main bearing bush into the flywheel, the oil being then led unto a semi-circular recess on the flywheel boss, which presses tightly

against the side of the crank case and registers with the oil channel, so that this recess is filled with oil under pressure, which flows through a hole in the flywheel to the centre of the crank pin, thus adequately lubricating the big end bearing. From the crank pin it descends again to the main bearing on the pulley side. There is also a passage for the oil from the main bearing to the hollow bolt running through the top of the crank case, where there is an outlet to the front cylinder. The non-return valve, which controls the supply from the crank case to the oiling system, is merely a flat steel disc.

Method of fixing the crank pin and main shaft journals.

From these few notes concerning the J.A.P. engine the reader may gather some idea of the care taken in its design and manufacture, while those who possess machines fitted with these engines will undoubtedly have gained a good deal of knowledge which cannot be otherwise than of great service to them.

### A D.S.O. MOTOR CYCLIST.

MR. RICHARD LAMBERT, who is the only actor to whom the Distinguished Service Order has been awarded, first of all joined the Army as a motor cycle despatch rider. Later on he became an officer in the Intelligence Corps, owing to his familiarity with both French and German. The most amusing part of Mr. Lambert's career is that when joining up (like a good many other people, we are afraid) he represented himself to be an experienced motor cyclist, when he had never been on a machine in his life. "It was at the beginning of the war," he said, "when we so badly wanted men, and what odds if I did draw the long bow in the matter of age and qualifications?" He was duly sworn in one Sunday morning, and spent the remainder of the day at Regent's Park endeavouring to become accustomed to his machine, so that he might make some kind of a show at the test the next morning. While practising he smashed up one machine, and when asked to do a figure eight he had a nasty fall; then, after being passed by a fluke, he set out for Southampton on the way to the

Front. "You can judge the sort of motorist I was," he told a daily paper correspondent, "when I tell you I started from London at two o'clock, and was due at seven in the evening for dinner, and I landed there at a quarter to one the following morning. Everything happened to me on the way. I got lost, and went miles and miles off my road, my engine broke down, and several times I had to take the thing to bits. It was an awful ex-

Mr. Richard Lambert.

perience." Mr. Lambert comes of a military family, in which there are two D.S.O.'s and one Military Cross, while the head of the family, Lord Cavan, is a Lieutenant-General, and is soon, we understand, to be head of an Army Corps.

### THREE ADJUSTMENTS IN 32,000 MILES.

THERE is nothing remarkable in the fact that the Coventry Chain Co., Ltd., frequently receive testimonials respecting their chains, but one they received from Messrs. H. Collier and Sons, Ltd., is more than usually interesting. The famous Matchless firm speak of a Coventry noiseless chain fitted to a "track" motor cycle, which had been driven by a large number of different persons. The mileage recorded to the credit of this machine was 32,000, during which time the chain called for adjustment only three times. At the last time of overhauling the chain was found to be in good condition, and did not call for renewal.

### TIMES TO LIGHT LAMPS. GREENWICH TIME.

Nov. 2nd	...	...	5.1 p.m.
" 4th	...	...	4.57 "
" 6th	...	...	4.54 "
" 8th	...	...	4.51 "

### Overseas Opinions.

Many interesting observations and comments are contained in the letters published in the present issue from motor cyclists Overseas.

### A Twelve-year-old Tricar.

Last week-end, in the neighbourhood of Derby, we saw a Raleighette on the road—running very well, too. The incident recalled pleasant memories of such a machine we owned in 1905

### An Australian Engine.

Mr. F. W. Johnston, the manufacturer of the motor cycle engine in Western Australia referred to on page 352, has asked us to state that he was formerly with the West Perth Garage and not with the firm mentioned.

### Contest for the Victorian M.C.C. Cup.

The cup offered in the twenty-four hours reliability contest held by the Victorian M.C.C. in August was won by J. Flece on an 8 h.p. J.A.P.-engined single-gear sidecar. The course was from Melbourne to Geelong, through Camperdown and Castlemaine.

### The B.S.A. War Fund.

The employees of the B.S.A., Birmingham, have issued a balance sheet in connection with their war fund, which shows that no less than £15,781 has been subscribed for charitable purposes.

Amongst a few of the grants are: Prince of Wales's Fund £1,481, Dependents of B.S.A. £4,274, Cigarettes £418, Prisoners of War £450, Serbians £250. The balance in hand is £6,357.

### Our Constabulary.

We continue to hear of strange cases in connection with the much revised lighting regulations. At East Ham police court recently a motor cyclist was fined for riding without either front or rear lights. The defendant said that a "special" constable had stopped him and told him to put his lights out as there was a Zeppelin raid taking place. Later he was held up by a police-sergeant, who said that lights must not be put out. "How am I to act in face of such contradictory orders?" asked the defendant. "There is no pleasure in driving a motor cycle in darkness!" He was fined 6s., the Stipendiary remarking that it was a mitigated penalty.

### Spring Frames.

The eighty-second design of spring frame is published in this issue—proof that *The Motor Cycle* campaign has succeeded in focussing attention upon this important subject. No doubt the fruits of the campaign will be seen immediately peace returns.

### Aluminium Alloy.

In the brief description of the Wisconsin aero engine in our issue of October 26th we mentioned that this engine is constructed almost entirely of aluminium alloy. This alloy, we understand, is known as magnalite. It is lighter in weight than pure aluminium, while, weight for weight, its tensile is equal to that of steel at 80,000 lb. per square inch. This alloy is largely used in America for pistons, and even connecting rods in both aero and car engines.

### A Lighting Regulation Laxity.

Referring to our remark in a recent issue regarding the illumination of the overhanging trunks of trees when being transported at night, a correspondent (Mr. W. P. Cooke) remarks that the regulation compelling a red lamp to be carried on any load projecting more than six feet to the rear has been compulsory in all districts since 1907. The point we wished to raise was that very often, in spite of this regulation, loads of trees, timber, etc., are allowed to be carried without any sign of illumination—an extremely dangerous proceeding in these days of reduced lighting.

### SPECIAL FEATURES.

ANOTHER R.A.F. HILL-CLIMB.

MORE SPRING FRAME DESIGNS.

OVERSEAS OPINIONS.

### From "On Service."

EXTRACT FROM AN INSPECTION REPORT.  
—"Engine missing—tow rope missing."

### A Flooded Road.

We hear that the road at Colyford, between Newton Poppleford and Lyme Regis, was flooded at the week-end to a depth of about a foot for a distance of 150 yards.

### Motor Cyclists required for the National Motor Volunteers.

It is proposed to form a squadron of motor cyclists to operate with the National Motor Volunteers, under the command of Major-General D. C. F. Macintyre, C.B. Platoons will be formed in the various London districts, according to the number of recruits.

Motor cyclists wishing to join should make application as soon as possible to Mr. G. E. Copley, 56, Harpenden Road, South Wanstead.

Mr. Copley advises us that he showed General Macintyre *The Motor Cycle* of October 12th containing the illustrated account of the inspection of the N.M.V., and told that officer that he hoped with our assistance to be able to get the men wanted.

The latest Enfield sidecar combination fitted with a hood and screen, which are now standardised fittings. An improvement in the design of body is noticeable, the scuttle dash being higher and giving better protection to the passenger.

**The National War Funds.**

At the week-end the principal war funds stood as follow:

The National Relief Fund (£3,474,475 distributed)	£5,968,051	0	0
The British Red Cross Fund	4,536,858	0	0
Tobacco Fund	116,440	0	0
Ritchie Memorial Fund (over)	347,000	0	0
The Queen's Work for Women Fund	170,801	5	0

**Semi-steel Pistons.**

The inflated prices of aluminium in America have led American engineers to tap new channels. At the present time, according to the American correspondent of our sister journal, *The Light Car*, interesting experiments are being made with what are known as semi-steel pistons, cast in metal moulds, and finished with very fine walls.

**The New Shop Closing Order.**

The Amended Closing of Shops Order fixing 8 p.m. as the closing hour for shops on every day other than Saturday or the weekly half-holiday adds an exemption for the sale of motor supplies and accessories for immediate use so long as the shop is kept open and lighted only for such time as is necessary for serving the customer. This news is, of course, of interest to all travellers by road.

**A Strenuous Contest.**

The Keystone Motor Cycle Club, Harrisburg, Penns., held their annual endurance contest on October 7th and 8th over a course of 408 miles. This contest is one of the most important ever held in the U.S.A., and this year the course proved to be an exceptionally severe one, including no fewer than eight mountain tracks. Only one motor cycle and one sidcar completed the course and obtained full scores. Both of these were 1917 Harley-Davidson three-speed electrically-equipped outfits. Neither of the machines experienced the slightest trouble, coming through without even a puncture.

**The National Motor Volunteers.**

On Sunday last some excellent work was done by the National Motor Volunteers, who conveyed eight hundred volunteer infantry in one hundred cars and motor cycles from a station in the South to the trenches which are forming part of the national defences. Numerous journeys were made, each occupying about fifteen minutes. An enormous amount of time was saved by transporting the men by motor vehicles, otherwise if they had to march they would not have reached their destination until about noon. The speed of transport is a very important item now that the days are so short.

**The Second-hand Show.**

The date of the second-hand show organised by Messrs. William Glass and Co., Lincoln House, 296, High Holborn, W.C., is rapidly approaching. The show will open on Friday next week, 10th inst., and will remain open until the following Saturday week. Mr. Glass, the principal organiser of the show, informed us, in an interview, that up to the present time about 100 motor bicycles had been entered, and that many more were expected. Entries, he said, were coming in very rapidly now. An interesting feature concerning the motor cycle entries is that most of the machines are of very recent date.

**News!**

Another hill-climbing competition has been held by employees of the Royal Aircraft Factory, Farnborough, and the event is described and illustrated in this issue. Incidentally, *The Motor Cycle* is the only journal that deals with week-end events in the succeeding issue.

**"The Autocar" 21st Birthday Number.**

Congratulations to our parent journal, *The Autocar*, which celebrates its twenty-first birthday on Saturday next, the 4th inst. The issue of *The Autocar* bearing this date is a special one, considerably enlarged, the greater portion being devoted to reviews and notes upon some of the leading events which have taken place in the motor world during the last twenty-one years. There is a series of reminiscences by such well-known men as S. F. Edge, A. J. Wilson, F. W. Lancaster, Col. Lord Montagu of Beaulieu, Claude Johnson, and Sir David Salomons, Bart. *The Autocar* is a year older than the British automobile movement itself, as it first saw the light on November 2nd, 1895, when it was not lawful to use a motor car or motor cycle at above four miles an hour, and unaccompanied by a man and a red flag. Until *The Motor Cycle* enjoyed a separate existence in the spring of 1903, our parent journal dealt with motor cycle matters.

**A-Problem of the Future.**

At the annual meeting of the Rudge-Whitworth, Ltd., the Chairman (Mr. C. Vernon Pugh) made some remarks which applied not only to the Rudge firm, but to motor cycle manufacturers generally. Speaking of his own company, he said that the volume of business being done for the Government was daily increasing, and had reached a very large and very important figure, and that the output of the company's own natural trades—cycles, motor cycles, and motor wheels—had correspondingly shrunk, and was now almost at vanishing point. Continuing, he thought it would be a problem, which the directors would regard with a considerable amount of anxiety, how the output of those natural products would be resumed when the present urgent necessity for Government needs slackened and, as they hoped, disappeared. Mr. Pugh went on to give a slight idea of the increased volume of business by mentioning the numbers of employees operating for the company in the last week before the war and at the present time. In the last week of July, 1914, the total employees of the company were 1,817, and in the week ending October 13th this year the total number of their employees was 5,770. That, of course, would illustrate, as well as any money figures could, the great growth of the responsibility which the company had undertaken. A dividend of 6% is being paid on the preference and 10% on the ordinary shares.

**Young Men on Home Service Work.**

Among the score of letters bearing upon military matters received by *The Motor Cycle* last week was one from a lance-corporal, twenty-two years of age, who seeks a transfer. He mentions that he is only one of twenty young fellows who have been stationed on the coast for a period of over two years, and he is keen to get to one of the fighting fronts.

**Twenty-eight Inch Wheels on Triumphs.**

Pte. S. Barnett, writing from France, says that some of the despatch riders with the 1st Canadian Division have been fitting 28in. x 3in. tyres and tubes on the rear wheels of their countershaft model Triumphs, and get reliable service from them. He thinks this information will interest many of our readers, and asks "Ixon's" opinion.

We should imagine that there would be very little clearance with 28in. x 3in. tyres, and it would be instructive to know the make of tyre fitted.

**Rural England and the War.**

Many a village in this country of ours has a record in the war of which it may be justly proud. In some cases the percentage of its able-bodied men who have donned khaki in the national cause is truly astounding. Some villages, recognising their big share in the war, have already erected crosses to the memory of their brave sons who have fallen. In yesterday's issue of *The Light Car* is the first of a series of articles dealing with this subject.

**Average Prices.**

We give below the average prices of second-hand models offered for sale in *The Motor Cycle*. Where it is possible to obtain a sufficient number of each model the average for the past week is quoted, otherwise the last average is given, if within four weeks.

Make.	Year.	H.P.	Average for last week.	Latest average obtainable

SOME OF THE SUCCESSFUL COMPETITORS.

- (1) One of the best performances was made by E. Mannings on a 3½ h.p. Norton, who won the 560 c.c. class.
- (2) Second in the sidecar class, F. W. Hartt, on his 7 h.p. Indian.
- (3) Winner of the 350 c.c. class, E. Perrott (2¼ Douglas)

## Another

### Informal Competition

IT is only a few weeks ago that the Aircraft Factory ran off a successful little hill-climb on the leading to Newland's Corner, which was duly reported in the issue of October 14th. Last Saturday G. Department of the R.A.F. organised an event of its own on a hill near Farnham. The start was outside the southern entrance to Waverley Abbey military hospital, two miles from Farnham on the Gilling Road. The course lay straight and was off the main road, and had a rather stiff hill, with a maximum gradient of about 1 in 8, through Scotch firs on Crooksbury. The day was excellent, but the road was rough enough to make the competitors with caution and to prevent fast being made.

#### The Wrong Hill.

A rather amusing incident occurred before the start. Officials spent a good deal of time and a considerable amount of care in marking the course and making arrangements for flagging before it was discovered that they had been working on the wrong hill. In fact, G. Department could hardly be called expert competitors, as this was their first attempt, but they did their best, and, most important of all, competitors and officials alike enjoyed themselves.

As regards the machines, there were a few points of interest. Mannings's Norton was fitted with one of the new mechanical Best and Lloyd lubricators, which, however, was connected neither to the engine, nor handle-bar control. Perrott's Douglas was equipped with sparking plugs fitted with aluminium radiating fins to the plug.

The weather was fine but cold, and the one little shower which fell towards the end in no way interfered with the event. The strong south-westerly wind was, if anything, in the competitor's favour, but was little felt owing to the sheltered position of the hill. All classes except the last, which was purely a speed event, were run off on the

Motor Cycle formula  $\left( \frac{C \times T^2}{W} \right)$

CLASS I.—TWO-STROKES UP TO 300

Two Levises only competed, both of which made excellent ascents. Results:

1. Mairies (2¼ Levis).
2. Edwards (2¼ Levis).

## ANOTHER FLAT TWIN

The latest Flat-twin Matchless 6 h.p. 350

OUR recent descriptions of the new Indian and Humber opposed to the Matchless have evoked considerable interest in motor cycling circles, and doubtless the announcement of the latest machine of this type will be similarly received.

By the introduction of a 6 h.p. flat-twin by Messrs. H. Collier and Sons, one more motor cycle concern of repute has joined the fast increasing number of supporters of this type of engine. The new Matchless has a bore and stroke of 70×95 mm. respectively, which gives a total capacity of 732 c.c. The lubrication is by an automatic forced system.

# Hill-climb.

Waverley Abbey, Farnham.

CLASS II.—LIGHTWEIGHTS UP TO 350 C.C.  
Cotterill's Douglas, which was a 1912 model, came up in first-class form for a four-year old; while Perrott's, which was a later pattern, made a good climb.  
Result:

1. E. Perrott (2 $\frac{3}{4}$  Douglas).
2. W. Cotterill (2 $\frac{3}{4}$  Douglas).
3. S. Tarr (2 $\frac{3}{4}$  A.J.S.).

CLASS III.—MOTOR BICYCLES UP TO 560 C.C.

Incidents in this class were few and far between. The outstanding feature of the class was the performance of Mannings's Norton, which was excellent, and was clearly the fastest machine there.  
Result:

1. E. Mannings (3 $\frac{1}{2}$  Norton).
2. E. Ambrose (3 $\frac{1}{2}$  Triumph).
3. H. Whitty (4 $\frac{1}{4}$  B.S.A.).

CLASS IV.—UNLIMITED.

There were several little items of interest to record during the running off of this class. Hambrooke (8-10 Matchless) was travelling well, but at the last moment his kick-starter pedal struck the ground and might have thrown him. Hart (7-9 Indian) got into the gutter on the left side of the road, swerved badly, made several desperate wobbles, and then made an excellent piece of riding recovered himself. Whitty (B.S.A.) was baulked by a taxicab. Result:

1. E. Perrott (2 $\frac{3}{4}$  Douglas).
2. W. Cotterill (2 $\frac{3}{4}$  Douglas).
3. T. H. Reeves (4 $\frac{1}{2}$  Bat-Jap).

CLASS V.—SIDE CAR COMBINATIONS.

W. Hartt (7-9 Indian) made a good climb. Another competitor, we are informed, changed up too early and stopped the engine. Result:

1. E. A. G. Langridge (7-9 Harley-Davidson).
2. F. W. Hartt (7-9 Indian).

CLASS VI.—FASTEST TIME.

There were no incidents in this event.  
Result:

1. T. H. Reeves (4 $\frac{1}{2}$  Bat-Jap).
2. S. R. P. Hambrooke (8-10 Matchless).
3. F. W. Hartt (7-9 Indian).

The principal officials responsible for the organisation were Messrs. J. N. de la Couche, honorary secretary; W. B. Mason, starter; T. Keyte, treasurer; and J. Lees. Previous to the event a collection was made to provide the spectators from the hospital with cigarettes.

## WELL-KNOWN CONCERN.

stroke, 95 mm.; capacity, 732 c.c.

It will be noted that the engine has a longer stroke than is usual with the flat twin, and its performance no doubt will be watched with interest. The new Matchless has many features in addition to its engine, among which may be mentioned a spring frame, exceptionally large tank with a capacity of two and a half gallons petrol and half-gallon oil, 700 75 mm. tyres, and primary transmission by silent chain, thence to rear wheel by roller chain. The gear box has three speeds, and embodies a kick starter, while the wheels are interchangeable and quickly detachable.

SCENES AT CROOKSBURY HILL.

- (1) Wounded "Tommies" interested in E. Mannings's start for the 560 c.c. class.
- (2) A Levis two-stroke climbing the hill in good style.
- (3) A picturesque spot near Waverley Abbey, with the competitors' machines in the background.

# THE FLAT TWIN AT THE BAR.

By "IXION."

SO long as the horizontally-opposed type of twin was practically confined to a single make, it was accepted largely on its proved merits; but now that it is threatening to dominate the motor cycle industry, various interested or prejudiced people have begun to spread all sorts of criticisms upon it and rumours about it. Such attacks as I personally have knowledge of are all without foundation—in fact, even when they masquerade as expert criticism in technical journals; and I shall be serving a good cause if I unmask some of these deceptions or delusions.

## Efficient Only in 350 c.c. Size?

Imprimis, it is stated that the flat twin, for some mysterious reason, can only succeed up to a capacity of 350 c.c. This allegation is apparently a spurious deduction from the difficulty of perfecting large air-cooled two-strokes, though the connection between large two-strokes and large flat twins is not obvious. At any rate, it is a pure invention. The Government are at present buying flat twins in three sizes exceeding 350 c.c., namely, 500 c.c., 1,100 c.c., and 2,300 c.c. The Censor will not allow me to state the purposes for which these engines are employed, though the Germans know all about them. But the fact of their service adoption, in the teeth of keen competition from the V and vertical twins and four-cylinders, disproves the above allegation. The 1,100 c.c. develops 22 b.h.p., and the 2,300 c.c. develops over 50 b.h.p., and is regarded by some technicians as being very possibly the most efficient petrol engine of its weight and size ever constructed. The acceptance trials of these engines, by the Government department concerned, include several ten hour days at full throttle, with examination of parts for wear at the conclusion of the test. In actual practice, the main shafts and bushes of these engines evince no wear perceptible to an ordinary micrometer after the acceptance test; if any wear at all is found, it will be in the valve gear, tappets, etc., and is not allowed to exceed  $\frac{1}{1000}$  in. even there, after a trial equivalent to a hard season on the road. The current idea that big flat twins are a failure is simply nonsensical.

## Spoilt by Overhead Valves?

Secondly, it is stated that the flat twin does not lend itself to overhead valves, and can never share the extra efficiency so obtained by rival types of engines. The contours and lengths of the piping are cited as a pseudo-technical justification of this view. This is a very curious accusation, seeing that the first 500 c.c. machine in the world to beat 80 m.p.h. on Brooklands was an overhead flat twin; that the only standard  $3\frac{1}{2}$  h.p. machine sold with a guarantee of 80 m.p.h. is of the same type; and that the 2,300 c.c. 50 b.h.p. engine, above mentioned as claiming all world's efficiency records, is also an overhead valve type. In sober fact, the length of exhaust pipes is a matter of no importance, and the length of inlet pipes ceases to matter within reason when the air supply is heated, as a moment's reflection upon the inlet manifold of a six-cylinder car will soon show. The pipes need not be sharply curved when either or both valves are mounted overhead—not more so than on a vertical single-

cylinder, for example. Many people consider that the A.B.C. practice of fitting an overhead exhaust above a normally placed inlet valve is of great value, as it relieves the cylinder of a "hot side," and so reduces the tendency to distortion under heat. This system is practically inapplicable to a touring vertical single or V twin, because the exhaust pipe is so hard to arrange; it is as neat as it is efficient on a flat twin.

Other alleged "problems" of the flat twin include lubrication, central thrusts, cooling, bearing areas, and housing. Of these, the topical "housing problem" is certainly very real when sizes exceeding 1,100 c.c. are considered; up to that point they have already been solved, *vide* the Williamson; and no larger engine of any type has ever yet been successfully "housed," nor is such a need likely to arise.

The sphere of lubrication is a peculiarly unfortunate selection for criticism, seeing that the 4 h.p. Douglas and  $3\frac{1}{2}$  h.p. A.B.C. both possess oiling systems far superior to those commonly standardised on motor cycles. These systems were not devised because the flat twin is specially exacting in point of oil, but simply because the designers of these engines possessed original minds, and tried to improve every detail.

## Generous Bearing Surfaces.

The question of bearing areas is too complex for full treatment here; suffice it to say that, in workshop experience, three-year-old "flat" twins with roller bearings show less wear when taken down than is allowed as clearance for brand new phosphor bronze bearings on more conventional engines. The Hoffmann Co., who know more than most people have forgotten about bearings and their loads, affirm that the bearings which they supply for flat twins are ridiculously large in proportion to the loads they carry.

So far as central thrust goes, it is not found on the Douglas, which does not appear to suffer in any perceptible way for the want of it; but it is to be found on the A.B.C. and the new Humber, and may be quite simply arranged for, when a designer has a preference for it. At the same time, by employing roller bearings, the pistons may be kept very nearly in line, though not absolutely so, as on the V twin. The superior balance and bearing durability of the flat twin suggest that the working of pistons in parallel planes, instead of in the same plane, is a matter of no importance. After all, the pistons of nearly all motor car engines work in parallel planes.

The plain facts are that the flat twin offers better balance and better torque than previous types of motor cycle engine, in conjunction with a reduction of weight and an increase of efficiency for a given c.c. For example, a 22 lb. engine of 249 c.c. will develop over 4 b.h.p. for a full throttle, full load bench test of 150 hours, and show no perceptible wear at the end; a 60 lb. engine of 1,100 c.c. will develop 22 b.h.p. for a similar test; or a 500 c.c. will develop over 12 b.h.p. under the same conditions. It would puzzle any manufacturer in the world to produce a trio of engines, either single-cylinder, vertical or V twin, or four-cylinders, to reach these standards, viz., power curve, weight, and durability.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

### Running on Paraffin.

Sir,—Mr. F. A. Holward would greatly assist riders of "two-strokes" like myself if he would kindly inform us: (1.) What proportion of oil he used to the paraffin? (2.) Whether the same sized jet will do for paraffin as is used for petrol? My engine is a 1915 2½ h.p. Sun-Villiers two-stroke, two-speed.

F. LEWIS.

### A Poser.

Sir,—In *The Motor Cycle* for October 26th there appears, on page 370, an article entitled "A Poser." I have heard of such a thing happening on a V twin, the owner of which fitted a piece of wood into the hole for the plug and inserted a piece of copper wire through a hole in the centre of the wood, and bent the wire to come within ¼ in. of the cast metal. This did all right until the wire was burned, but to remove a piece of rubber and push the wire a little further in was the matter of a few seconds. I would have tried this myself, but I have had no time.

D. BAYACH.

### American Motor Cycles.

Sir,—Replying to "Prospero," in your issue of the 5th inst., surely it is rather far-fetched to argue that, because "to the best of his knowledge" railway engines of American manufacture in 1900 are scrapped in 1916, American motor cycles of 1916 are not worth investing in!

"Necessity is the mother of invention" even in 1916, and this explains the superiority of British and French aeroplanes.

"Prospero's" admitted restlessness scarcely presupposes a lengthy experience of American motor cycles, and it is hardly fair adversely to criticise without such experience.

Again, if "Prospero's" example of buying is typified in his Ariel transaction, surely that is hardly the course a fair critic would adopt with any machine.

Now for the dogmatical part of his letter. He says, "Time is the test, and the prices of British and American second-hand machines tell the tale." Being a confirmed student of your second-hand tables week by week, I felt convinced "Prospero" was wrong, so went to the trouble of getting out the following table, founded on your "Buyers' Guide" for 1915 (for original costs), and your "second-hand tables for the last three weeks available, viz., September 14th, 21st, and 28th respectively:

Date of Issue.	Make and H.P.	Year.	Original Price.	Sale Price.	Depreciation.	Near Average Depreciation.
Sept. 14	Enfield (6) .....	1915	£84	£70	£14	£15
" 21	" .....	"	£84	£68	£16	
" 28	" .....	"	£81	£69	£15	
" 14	Matchless (8) .....	"	£92	£74	£18	£18
" 21	" .....	"	£92	£74	£18	
" 28	" .....	"	£86	£75	£11	
" 14	Harley-Davidson (7-9) .....	"	£86	£70	£16	£15
" 21	" .....	"	£86	£69	£17	
" 28	" .....	"	£88	£62	£26	
" 14	Zenith (8) .....	"	£88	£62	£26	27
" 21	" .....	"	£88	£60	£28	
" 28	" .....	"	£98	£70	£28	
" 14	Williamson (8) .....	"	£98	£52	£46	£37
" 21	" .....	"	£98	£52	£46	
" 28	Indian (7-9) .....	"	£88	£69	£19	

It is not "the restless motor cyclist who is always changing machines" that is capable of judging the merits of any particular make. If, say, a rider of at least two years' riding experience of an American motor cycle will weigh in with a detailed dissatisfied account of his ownership, I shall

perhaps begin to think that my meagre intelligence has been at fault in investing in my Harley-Davidson J.W.

### Automatic Inlet Valves.

Sir,—With reference to "E.J.C.'s" reply to my query re automatic inlet valves, might I point out that in my case loss of compression is not caused by a leak between the valve case and the cylinder, but between the valve itself and its seating. To prove this, I put a circle of thin rubber between the face of the valve and its seat, and then the compression was as good as desired.

Repeated grinding in of the valve has made very little difference, the valve face and seat are perfectly smooth and bright, and three garages I have taken it to say it is in good condition, and cannot see why it leaks.

Can any reader enlighten me as to what to do, or where I might be able to obtain a new valve case? (It is a very old engine, and I do not know the maker's name.)

London.

L.F.I.

### Vibration.

Sir,—This question was touched upon twice in *The Motor Cycle* for October 19th—first by Lt. Davison, who stated that he had ridden a 4 h.p. single, geared low (5½ to 1), under all conditions in Flanders, and that vibration was not noticeable; and "Ixion," who is of opinion that "twins" only are vibrationless. I should very much like to see an article on this subject written by one of your experts—a medical man for preference—and covering the following points:

1. Single v twin—power and gears
2. Correct position of handle-bars and saddle.
3. Springing, handle-bars frame and footboards.
4. Pace.

This information (up to date) would be very useful to men like myself who are getting above middle age and use a motor cycle day after day on business. Apart from vibration, motor cycling seems more and more to be becoming an old man's pastime. I often see two grey-haired old men, who must be close on seventy, thoroughly enjoying themselves on the country roads on Douglas machines, albeit taking all corners very carefully.

W.S.T.

Reading.

### A Hot Induction Pipe.

Sir,—I have noticed several times in your journal that a heated induction pipe is really necessary for the successful vaporisation of paraffin in a motor cycle engine.

I think if manufacturers of motor cycle engines were to cast an induction pipe *en bloc* with the cylinder, as shown in the sketch, the paraffin would enter the engine in a more vaporised form.

A FIFTEEN YEAR OLD READER.

### Compound Spring Forks.

Sir,—The account of a trip which I made on my 3 h.p. Enfield may interest your readers. Starting from Newcastle-

The new design Enfield spring fork fitted to the writer's machine.

on-Tyne, I passed through Hexham, Alston, and Penrith, reaching Keswick on the first evening. On the second day I crossed Dunmail Raise, and proceeded *via* Windermere, Kendal, Lancaster, Garstang, and Preston to Liverpool, where I stayed the night. Next morning, having crossed the ferry to Birkenhead, I took the mountain road to Holywell, Abergelle, Colwyn Bay, and Llandudno. During the whole trip I had no cause to use a spanner, my only stop being due to a puncture near Penrith. I find the extra springs at the top

"3 H.P." seated on the Enfield twin, the forks of which are fitted with the special spring mentioned in his letter.

of the forks a great improvement over my last mount, a 2½ h.p., as they take all the road shocks from one's hands. The usual disclaimer. 3 H.P. Rockferry.

### Will the Single-cylinder Survive?

Sir,—As time goes on, I marvel more and more how this question can still be repeatedly raised, and how there can be any doubt about it in the minds of motor cyclists when the war has proved so conclusively that the "single" will not only survive, but that it will do so upon the merits of reliability, durability, simplicity, and economy, upon which it stands supreme.

My riding experience extends over a mileage of 35,000, ridden on various machines, twins and singles, and latterly 7,300 miles on a 4 h.p. countershaft Triumph, in all over 42,000 miles. Briefly put, I may say that no twin in existence would tempt me for solo use, and only for sidecar touring work would I give the preference to the twin at all, and that a heavily built twin. With the usual disclaimer, SINGLISSIMUS.

Sir,—"Ixon's" opinions on the question of single *v.* twin are quite interesting. They, however, leave me with the impression that he is only arguing on singles with inside flywheels, and that in his vast experiences he has not really tested the one with the outside flywheel, viz., the Blackburne. My experience of this has been quite satisfactory, viz., 20,000 miles mostly with a sidecar, original bearings still good, and 9,500 miles before the big end was touched. The vibration

B22

he complains of is a "negligible quantity," and after some experience with twins I am very dubious if there are any that can approach this for reliability with long life. As regards the bearings on the connecting rods, there is need for much improvement in twins in connection with the lubrication, which, until perfected, does not tend to a large mileage. C. E. SYDENHAM.

Sir,—Mr. K. V. Chidley misquotes my letter on the subject of single *v.* flat twin rather badly. I did not say that running an engine on a low gear would wear it out any more quickly than a high gear; nor did I advocate "thumping up hills" at low speeds on a high gear. It is being forced to do fast hill-climbing on a low gear because the engine is incapable of doing it on a high gear that I object to.

If Mr. Chidley's Brough climbs Dashwood Hill at 25 m.p.h. on a 4½ to 1 gear this is a very good performance for a flat twin, but what does he do if he wants to make a faster ascent? Changes down, I guess. On the other hand, there is not much difficulty in finding a 500 c.c. single which will nearly double the speed he mentions, with a 4½ to 1 gear, on Dashwood Hill.

The reason why I "imagine that a flat twin with worn chains, sprockets, gear box, and with the engine getting slack will make more noise than a single in like condition" when doing fast hill-climbing is that the twin will have to do about double the engine speed of the single, in my experience, for the same road speed. For slow hill-climbing let us use a low gear by all means.

I contend that, however well balanced an engine may be, it is most unpleasant at very high rates of r.p.m., which are only tolerable at very high road speeds, when one has other things to think about than the racket of the engine; and, further, that existing systems of transmission, involving chain drive from the engine, will not stand these high rates of r.p.m. without rapidly becoming exceedingly noisy.

A portion of the modern motor cycle which is in much more urgent need of improvement than the engine is the transmission. A. C. HUSKINSON.

### The Scott Sociable.

Sir,—I have been greatly interested in the letters appearing in *The Motor Cycle* criticising the Scott Sociable.

Mr. F. Greenwood is most certainly in error in stating that the sociable has difficulty in mounting the camber of the road when on the near side. I have driven this machine many thousands of miles, and have never had the troubles referred to, not even when the camber was abnormal and the surface very greasy.

From Mr. Greenwood's remarks, that "However the steering wheel was turned the front wheel refused to right itself," it would appear that the steering wheel was independent of the front wheels, which would be hardly conducive to traffic driving.

The most probable solution of Mr. Greenwood's impression is that the engine was cold and (similarly to the majority of cars) developed little or no power when just started up, or possibly the near wheel was jammed against the kerb, necessitating pushing the machine.

I have no hesitation in stating that this machine steers easier and has less side pull than any sidecar combination on the road. It also possesses a feature which will appeal to many sidecarists, that is, it is impossible to lift the near wheel, even when no passenger is carried. As for comfort, both the driver and the passenger are kept clean, dry, and warm, and the riding is more luxurious than any sidecar I have ever been in. The starting up from the seat is always sure and effective.

When the machine is standing it is hard to turn the wheel; this gives the sidecar machine a slight advantage, but as this stiffness is usual with all cars, it is not noticeable.

If Mr. Greenwood is in Bradford in the near future, I shall be pleased to arrange a trip (time permitting) in this machine, and overcome his objections.

H. O. WOOD,  
The Scott Engineering Co., Ltd.

### Mending Punctures.

Sir,—If J. D. Robinson will use properly prepared patching and good quality solution he will not need to resort to the push bicycle method of clamping as sketch. In any case, if a patch needs treatment of that sort, it shows it has been put on too wet WM. TURNER.

# ANOTHER BRITISH MAGNETO.

## Details and Illustrations of the P. M. Magneto.

WE are able to give a few details concerning a new motor cycle magneto which is now being manufactured in this country. Messrs. Phillips Magnetos, Ltd., Birchett Road, Aldershot, the firm responsible for its production, have specialised at the outset on magnetos for motor cycle engines. The types constructed at the present time are made to run in a clockwise or anti-clockwise direction for single-cylinders, 50° twin-cylinders, and the horizontal type of engine. While examining a magneto in its various stages of manufacture, we noted that the workmanship was good throughout, the parts being well made and well finished. The production of the magneto has not been rushed through, the firm having been engaged upon evolving an efficient machine ever since the war started, and the subject is being tackled

in a thoroughly businesslike manner. Messrs. Phillips hope soon to extend their plant so that their weekly output will run into four figures.

Contact breaker end of the P.M. magneto.

Externally, the P.M. magneto does not differ greatly from the types to which the motor cyclist has been accustomed from the beginning of his career, but the following details will prove interesting. The end plate on the spindle side is so manufactured that the same end plate will do for a single or a twin, the flat side thereof opposite to the high-tension terminal being left so that it can be bored and drilled in order to take an extra terminal and carbon brush holder. Following standard practice, the condenser (in the manufacture of which much care is exercised) is carried at the end of the armature, while the method

of fixing the armature-shaft is also worthy of mention. The armature-shaft is squared and tapered, and is fitted into the brass end plate of the armature so that the largest end of the taper is inside, and is so rigidly fixed that it cannot possibly be pushed out.

In addition to this method of fixing the end is burred over, thus making it doubly secure. The magneto, of course, runs on ball bearings, the bearings on both sides of the armature being of the same size. The high-tension wire is fixed in the brush holder by a sharp pointed brass screw, the point of which penetrates the insulation and thus makes good contact with the high-tension wire. With this fixing the wire is just pushed into the socket, and, provided it is home, it is only necessary to insert the screw and screw it up tightly. The magnets, as are all other parts of the machine, are made entirely at Messrs. Phillips's works. We saw one magnet holding some scrap iron which weighed 17 lb. The platinum points are of ample dimensions and welded to the screws.

Section of the brush holder, showing method of securing the high-tension wire.

The new British P.M. magneto.

## ALUMINIUM PISTONS.

FOUR samples of aluminium pistons made by the Aluminium Alloy Pistons Co., 6, Great Marlborough Street, Oxford Circus, W., are shown in the accompanying illustration. They are composed of special aluminium alloy, and are made for the principal makes of motor bicycles. They are intended to be supplied direct to the manufacturers and not to private owners. The pistons manufactured by this firm range in size from 62 mm. up to 8in. in diameter, and no less than fifty different types of all shapes and sizes have been supplied to various well-known firms.

From the samples illustrated, it will be noticed that there are two for two-stroke engines, one of which is in an unfinished state—a piston with a broad groove in the centre for the purpose of oil retaining, and an ordinary flat top

four-stroke piston. It will be apparent that the latter has tiny holes, which are drilled through a small groove running below the edge of the bottom ring groove. One at least of the pistons is to be used as an experiment by a leading motor cycle manufacturer. The advantages offered by aluminium alloy pistons are—lightened reciprocating parts, and consequently better balance and higher engine speed.

## A STARTING TANK.

FOR starting when using heavy fuel the small tank device which we are about to describe has lately been provisionally patented. Particulars have been sent to us by Mr. H. P. Baker, 1, Camden Villas, New Street, Westerham, Kent, on behalf of the inventor, Mr. Baxter.

The device consists of a small tank about 3in. in diameter and about 6in. high, which is designed to be screwed into the induction pipe in the manner

The tank referred to by Mr. Baker, which is screwed on to the induction pipe.

- E. Filler cap.
- B. Needle valve.
- C. Valve seating.
- I. Inlet pipe.

shown in the illustration. The tank is supplied with a needle valve and a small filler cap. When it is required to start the engine, the needle valve B is unscrewed and a few drops of petrol allowed to drip into the induction pipe. The engine will then start, and the heavy fuel may be turned on. It is claimed that the tank holds sufficient petrol to enable an engine to be started and to warm itself up on petrol about five hundred times.

Specimens of aluminium alloy pistons for four-stroke and two-stroke engines. The one on the extreme left is a rough casting of a two-stroke piston as it comes from the sand mould.

## OVERSEAS OPINIONS.

IT seems strange, now that the weather conditions here are approaching a stage so dismal that articles discussing the most suitable equipment to ward off rain, wind, and snow are deemed necessary, that our brothers of the wheel Overseas—and particularly those in the Antipodes—are looking forward to summer awheel. Of course the requirements of the Army must make a good deal of difference to the amount of riding possible in the British Dominions this year, though motor cycles long ceased to be vehicles of pleasure only. They have, indeed, become so much a part of our daily routine that, robbed of their utilitarian value, many of us would be almost stranded. Apart from that motor cycles have become such a dependable method of travel that thousands of men over military age—and family men at that—have been won over by their attractions.

During the past month our Overseas mail bag—despite the unpleasant attentions of enemy submarines—has arrived regularly with accounts of sporting motor cycling events in the different parts of the globe where motor cycles are popular.

In the race meeting of the Goldfield Motor Club, held on September 3rd on the dried up bed of Lake Perkollilli, it was satisfactory to note that British motor cycles figured very prominently, not only in proportion to the machines represented, but in the results.

The result of a South African competition reaches us from Mr. T. J. Chester. It was the Pietermaritzburg Club's annual trophy run—157 miles of rough roads. We notice several points of interest. The winner was mounted on an A.B.C., which lost eight marks in a thousand, all for being slightly out of count at the secret checks. Thirteen out of twenty-three machines were big American twins—this in a British colony. A little  $2\frac{3}{4}$  h.p. Sun, with no gear but a Philipson governor pulley, managed to finish and to beat two American 7-9 h.p. twins.

One of the most important Australian events of the year was the Victoria M.C.C. "night to night" trial, as it was called. Full details had not reached us when going to press, but a photograph is to hand of the winner, J. Fleece, who, it appears, was mounted on an 8 h.p. J.A.P.-engined single-gear sidecar outfit. We doubt not that there has been great discussion since this remarkable success, in view of the lack of a gear or clutch on the sidecar in question. It seems to upset many arguments, but it is not really so. Evidently Mr. Fleece is a rider of rare skill. Even in our own Scottish trials a single-gear twin-cylinder sidecar outfit has been taken round

one of the worst courses ever selected, but only by dint of much athletic work on bends and hills.

### Other Motor Cyclists' Views.

Appended we quote a number of extracts from Overseas letters, many of which harp upon the old topic of the desirability of spring frames. Those who support such pleas will be interested in this issue, in which a number of spring frame designs appear as a result of the campaign *The Motor Cycle*, has waged for many months past.

We frequently, as will be seen from the extracts quoted, receive letters from readers serving with the Overseas Forces. These letters as a rule are of a most interesting nature. Overseas riding conditions undoubtedly require an even running engine and plenty of ground clearance, two points in which the "flat" or horizontal twins render themselves most suitable. It is, therefore, interesting to see the two new makes of this type, which have been described and illustrated in this journal recently; the flat twin Humber should undoubtedly prove an attractive "after the war" Overseas machine.

### An American Rear Car.

Mr. W. T. COOPER, Toronto, Canada: "I take this opportunity to draw your readers' attention to a new American machine of unusual design. I enclose a picture of it.

"The Cygnet, as it is called, takes the form of a rear car. It has two wheels, and fastens to the rear of the motor cycle, making the outfit a four-wheeler three-track vehicle. The driver is still exposed to the elements and with the same old back-breaking saddle. The passengers are three times the distance from one as in a sidecar outfit. Do you think this is an improvement on the sidecar? Would you buy this in preference to a two-track side-by-side seating cycle car, which would cost no more to keep up?

"If Mr. S. L. Burnard calls the Scott Sociable an ugly, clumsy thing, what would he call this? The Scott Sociable is an improvement, but the Cygnet seems to be bought only because it is something new. It is built by the Cygnet Rear Car Co., Buffalo, New York."

Cygnet rear car attachment referred to by W. T. Cooper, the writer of the accompanying letter.

## Overseas Opinions.—

## Road Dangers.

Mr. S. A. AUSTIN, Stanford Merthyr, N.S.W.: "I now ride a 5-6 h.p. M.A.G.-engined Rover, which cost me £110 without lamps or speedometer. The sidecar cost me a further £19. So you see motoring out here is rather expensive fun. I think my machine would be better with two exhaust pipes extending to the rear axle instead of the aluminium silencer which is now fitted, and is so near the ground that it often fouls the humps. Most of the riding is through bush country out here; no brick walls, like in London. The only thing is one has to be careful that rabbits or hares do not dive across the road into the front wheel."

## The "Bunyip."

Mr. C. HARDING, Parramatta, N.S.W.: "A short time ago I was spending a holiday in the Illawarra district, and had a very amusing experience. There was a spot where the track passed near a water-hole, which, according to the stories told by the local 'blacks,' was inhabited by a 'bunyip.' Now, the 'bunyip' is the aborigines' idea of a ghost or spook. For instance, if a spot is supposed to be haunted, the aborigines will say that a bunyip lives there. This imaginary creature is supposed to inhabit swamps and water-holes, and is greatly feared by the natives. I was passing this particular spot one very dark night on my way back to the station where I was staying. As I drew near the water-hole I heard a strange shuffling noise ahead of me. I had a splendid lamp (a very big P. and H.), and as I looked ahead I saw what seemed to be a mass of glittering stars, stretched across the road and into the bush on either side. I promptly lowered the Zenith's gear, and let the machine crawl slowly forward; at the same time I got out my Colt's .44, which I had in my hip pocket. The 'mass of stars' started jumping about as I got closer, and I began to feel 'a wee bit queer.' I listened intently for any sound which might give me a clue to the meaning of the strange phenomenon. The glittering mass was now only about twenty-five yards ahead

of me, and as I stood beside my machine I could almost feel my hair standing up. Not a sound could be heard. Suddenly a loud 'Baa' broke the ominous silence, and relieved my suspense. It was only a flock of sheep standing in the darkness, with their eyes glittering in the light of my lamp. I felt rather sheepish, I can tell you. In a country like this (Australia) motor cyclists often have very novel experiences. I have had a Brooks saddle almost eaten by a cow who suddenly developed a taste for leather, and, again, I have had tyres eaten through by a cockatoo."

## Motor Cycles for India.

Mr. F. GOODWILL, Bangalore: "Good makes of English motor cycles seem to do well generally in South India, both solo and sidecar; but greater cooling surface for cylinders is very desirable in view of the high temperature of the atmosphere. The 3½ h.p., suitably geared, will take a sidecar with a reasonable load, but sometimes one wishes for a little more power to cope with heavy roads and strong monsoon winds, seeing that repair shops are often far from the trouble, and almost every motorist one meets grumbles at the carelessness and inefficiency of the Indian workman."

"A 6 h.p. twin came, through me, into the market lately. The engine was in perfect order, but its low clearance spoiled trade to the tune of £15 to £20. It was positively unsafe for the ruts of country roads. It was a 1913 model with about 3½ in. clearance."

"I have been interested in Colonial reports of prices charged for new machines and spares. The matter needs attention of an urgent, pushing nature here in South India. A Madras firm was lately advertising itself as agent for not less than twelve different makes of motor cycles. I think it a pity that trade should be put so entirely into the hands of one firm."

"Thanks for your campaign on rear sprung frames. I lately went twenty-six miles out and home with sidecar on a country road, yet a main road. Before ending the return journey I vowed that my next *must* be rear sprung. But my average speed was only 16 m.p.h., and that with most careful watching of pot-holes."

SIGNAL SECTION IN A FRENCH MARKET SQUARE.

An interesting official photograph of the Indian Army Corps signals, lorries, cars, and motor cyclists on their way to the Front. The picture well shows the fit state of the men, who are mounted on W.D. Triumphs, the officers having Singer light cars.

**Overseas Opinions.—**

"Then, for India, every nut ought to be castellated or spring-washed. A friend of mine has shed most possible items from his machine in the course of about 3,000 miles; but he lives in a country town and gets little city driving. For myself, I ought, if you can permit such a direct testimony, to say that my Rover has run 7,000 miles in India, town and country, and has shaken but one nut loose, and dropped not an atom of metal to date."

**British v. American in Australia.**

"GUNNER," A.I.F., France: "The controversy at present raging in your paper regarding the merits of British and American machines interests me. I can truthfully say that so far as Australia is concerned British machines are becoming less popular. It is not due to design, workmanship, or anything else concerning the machines themselves, but to the agents, who charge exorbitant prices both for machines and parts."

**More Difficult Riding Conditions.**

"GUIDE WARBRICK," Gisborne, Australia: "I have been a subscriber to your journal for so long now (upwards of ten years) that I seem to know you quite well. I am sure I do; and I write you these few lines in the hope that a Colonial motor cyclist's views may interest you. From time to time I read in *The Motor Cycle* the views of New Zealand motor cyclists on the question of Colonial models, but most of them appear to have regard to the conditions existing in the particular district in which the writer lives, the result being that we have the ideal Colonial mount presented in many different forms. In some of the provinces here, Canterbury and Hawke's Bay for instance, the roads are really good, and the enthusiastic rider will use his machine the whole year through, while in Poverty Bay the conditions are simply appalling in winter. Gisborne is the largest town by far in this latter district, and for five or

six months in the year one may get bogged within two or three miles of the town, and, except for about twenty miles on one road, progression on a motor cycle is impossible. There are other provinces in which similar conditions exist, though to a lesser degree. Now a motor cycle to be of real use here must be built to meet our most adverse conditions, conditions such as will be met with by any rider undertaking a serious tour—rough roads, rougher hills, and stretches of sand. Ten years of motor cycling in New Zealand have taught me the value of plenty of power. I plump for a 6 or 8 h.p. twin with three-speed every time, particularly if a sidecar is used. My present mount, a  $3\frac{1}{2}$  h.p. Scott, is the smallest powered machine I have used for three or four years, and, while I find it a splendid machine on good roads and hills, it is a little unsuitable under other conditions, and I intend replacing it with a big English twin this summer. Mudguards are the worst feature of the ordinary machine. Some of the guards are splendid on wet roads, but when one gets into the thick mud they cause the wheels to stick and progress ceases. I have been pulled up in low gear on an 8 h.p. twin with mud in the guards and wheels. The only way to keep going in these circumstances is to ride through all the pools and keep washing the mud out, but this is not always safe. So let us have wide, almost flat guards, the wider the better, and do not have any guards which encircle the rims. Then we should have good clearance. (I have seen two Clynos, excellent machines in other respects, with punctured crank cases.) Totally enclosed chain drive (or shaft). Four speeds in the gear box are better than three, with a large clutch and a very low gear. A good spring frame would do more than anything to popularise motor cycling, and it has given me great pleasure to follow your campaign in this direction. In the interests of the pastime, I hope you are entirely successful. Sidecar connections should be stronger, likewise mudguards. Apart from new sidecars, you rarely see one with a mudguard. Connections are constantly breaking; frames occasionally."

## A TWENTY-FOUR HOUR CONTEST.

### A BRITISH MACHINE WINS THE VICTORIAN CUP.

WE are glad to see that the prestige of the old country is being upheld in the Colonies, and though we cannot hold competitions as in pre-war days, it is good to observe that when it comes to a strenuous test the British mount still retains its supremacy. In Victoria, during August, a "night to night" trial took place, J. Fleece winning the motor cycle cup given for sidecars over 600 c.c. It will be seen from the illustration that his sidecar outfit has an 8 h.p. J.A.P. engine, and is belt driven and single-gear.

**The Route.**

The Western district of Victoria was chosen for the scene of the contest, the route being from Melbourne to Geelong, through Camperdown, and continuing the main road to Warrnambool, thence to Koroit and back to Warrnambool. The direction then followed was to Mortlake, Skipton, and Ballarat, then across to Wearyborough and Castlemaine, thence to the city by the main Bendigo road. The trial was a thorough test for machines, and for human endurance also, as competitors in our own reliability contests will agree if they know the country traversed.

The winner of the Victorian Motor Cycle Cup—J. Fleece. A remarkably efficient lighting set is shown, a car head light being fixed to the forepart of the sidecar, in addition to the usual head lamp on the bicycle. Inset, the handsome silver cup which he won in the twenty-four hour contest.

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

### Double Belt Drive.

**?** In *The Motor Cycle* of September 9th and 16th, 1915, I saw letters on double counter-shaft pulleys, with gear ratios of 5 to 12 to 1. Can you give me the address of the manufacturers? Also, can you give me any information as to efficiency, durability, and simplicity?—E.H.

We do not think the pulley you mention is at present on the market. Most of those in use are made privately. The contrivance is simply a double pulley with the central flange, that which is in contact with both belts, slidable on the axle, the whole mounted in such a way that it can be moved backwards and forwards. It is quite satisfactory in itself, but the front belt wears badly, as it is so short.

### Loss of Power.

**?** I have been taking down my motor cycle for cleaning, etc., but cannot have put it together correctly. When the machine is on the stand it will run all right, but when I get astride the saddle on the road the engine has no power and stops. I can now pedal engine round on the stand without using the valve lifter, which I could not do before overhauling. (1.) Do you think the valve timing is wrong? (2.) When I was putting in the piston I broke a piece out of the skirt. The valves are at the side of cylinder, and there is only one piston ring. Do you think the piece being broken out is the cause of the loss of power?—C.F.B.

(1.) Carefully examine your valves and see that they are closing properly. If they are not this is obviously the cause of the loss of compression. You can easily check the valve timing, which should be as follows: Set the exhaust valve to close just after the completion of the exhaust stroke. It will then commence to open when the piston is about one-seventh of the length of the stroke from the bottom of the firing stroke. The inlet should commence to open as the exhaust closes, and remain open for rather more than one complete stroke of the piston, or while the fly-wheels turn through 190° or 200°. (2.) We do not think the small piece broken out of the bottom of the piston will appreciably affect matters. It would be better to have a new piston, but, on the other hand, we do not think there will be any objection to running your present piston until the new one arrives.

### Single Gear and Sidecar.

**?** I have a 1909 3½ h.p. Triumph, free engine, no gears. It is on the point of being returned by the makers with the engine re-fitted with new parts. It has previously been used as a solo machine. Do you think it will take a sidecar up a hill on its present fixed gear? I do not want to go to the expense of speed gear. Passenger's weight, 9 st. 10 lb.; mine, 15 st.—T.S.R. (Scr. R.A.M.C.)

You do not say whether your Triumph has an adjustable pulley, or what the gear is; but, if suitably geared, say 5 or 5½ to 1, it should be quite satisfactory in any but a hilly district.

### IMPORTANT NOTICE.

#### GOODS MADE IN GERMANY.

The proprietors of this journal, being fully in accord with the recommendations agreed upon at the Paris Economic Conference, give notice that they will not permit the advertisements of new goods manufactured in enemy countries to appear in this publication, either during or after the war.

ILIFFE & SONS LTD

### Accumulator Charging.

**?** In *The Motor Cycle* for September 28th you gave instructions for charging accumulators from house lights. Will you kindly inform me whether the voltage of the lamps matters, e.g., whether the voltage of the lamps subtracted from the voltage of the supply mains should equal the voltage of the accumulator? Also the number of metal filament lamps, thirty watts at 200 volts, required in resistance to charge two volts two ampere hour accumulators?—H.V.C.

When charging accumulators it is necessary that the voltage of the supply should exceed the voltage of the accumulator, and unless you are using the lamp for lighting purposes while charging a high voltage is extravagant. Beyond these points the voltage does not matter. Accumulators should not be charged at a higher speed in amperes than is marked on them (this varies with the size and output), but they may be charged at a lower rate. The little accumulator you mention should not be charged at a higher rate than .2 ampere. As watts equal volts × amperes, the thirty watt lamp on a 200 volt circuit will require .15 ampere; and one lamp will be sufficient.

### Magneto Sprocket Slipping.

**?** The sprocket wheel which drives my magneto, fixed to the magneto on a taper screwed tight home, is constantly slipping slightly, and so upsetting the timing of the machine. The fit by contact alone and tightly screwing up seems in my case scarcely sufficient, although I am aware other users of magnetos do not often get this difficulty. Can you suggest a remedy?—E.D.H.

The taper fitting is in most cases quite satisfactory. What has probably happened is that the taper has become worn. Get a good mechanic to verify this and refit the sprocket, and we think the trouble will cease.

### Skidding of Back Wheel at Starting.

**?** I have a 3½-4 h.p. combination fitted with Armstrong three-speed gear. A kick-starter is fitted, but I have never used it, but have preferred to push to get a start. Lately, however, when starting, some difficulty seems to have arisen, the back wheel skidding along for a considerable distance. When a start is ultimately obtained no further trouble arises, neither does the skidding always occur.—W.F.D.

The trouble, we should say, is due to your not having the exhaust valve lifter adjusted so that it raises the valve sufficiently. Also, you may be advancing the spark too much when you attempt to start.

### Lamps used near the Coast.

**?** The glass of my motor cycle head lamp measures 4½ in. in diameter. I have been repeatedly warned by the constable in one district in the West of England. He is the only complainant. Kindly inform me if it is or is not necessary to dim a head light of such dimensions.—W.G.S.

The diameter of the glass must not exceed 6 in. Within six miles of the sea anywhere in the United Kingdom, or within six miles of navigable waters of any estuary, the glass must be dimmed with one thickness of ordinary white tissue paper, or ground-glass, or a disc of other uncoloured material. Over the glass must then be placed a cap or disc of opaque material, and in it there must be six ½ in. holes, spaced approximately evenly round the disc so that no portion of any of the aperture is nearer the centre of the disc than one-quarter the diameter of the effective front of the lamp.

### Acetylene Generators.

**[?]** I am always having trouble with my acetylene lamps. Is it possible to have one generator for the front and back lamp? I mean a large one. What is the difference between a Low generator and a Rushmore?—G.B.

One generator will usually supply the front and back lamps, but you should have a Y connection so as to branch off from the generator to the two lamps. The Low generator is a self-generating system of compressed acetylene. The Rushmore is a generator designed more or less on standard lines, but with a shaking grid, which shakes down dust to the bottom of the generator, leaving only the unconsumed carbide to be attacked by the water.

### Carburettor Trouble.

**[?]** (1.) My machine is a new 1916 5 h.p. twin, ridden solo. When opening up gently off the pilot jet the engine nearly always chokes, necessitating the throttle being closed again before the engine will recommence to fire. This occurs no matter what amount of extra air is given either at the pilot jet or main throttle. The only variation is that sometimes the engine can be induced to fire again by opening the main throttle wide (again irrespective of the amount of extra air being given), but this, of course, produces an enormous and violent acceleration, accompanied by great "snatchiness" in the drive. Can this choking be remedied? (2.) On anything like a poor surface the front fork spring clatters very violently between the two rubber stops. The same thing occurred on a second-hand 7 h.p. T.T. model of the same make which I previously owned, and I then put it down to wear, but that cannot be the reason in the present case. Can this noise be stopped? (3.) Can you inform me whether I should get satisfactory results if I fitted another carburettor in place of the semi-automatic now fitted? (4.) I contemplate reducing the gear and lowering the compression for winter running. If I fit a plate between the cylinders and the detachable heads, shall I have to obtain new and longer holding-down bolts, and will the existing provision for adjustment at the inlet rockers be sufficient or will longer rods be required?—A.G.T.

(1.) We can only think that the main jet is partially stopped up. Carefully overhaul your petrol system and see that there are no obstructions. Perhaps the sudden opening of the throttle causes part of the obstruction to be drawn through and the choking is temporarily remedied. Until the engine has warmed up keep the extra air closed. (2.) Carefully examine the spring and note if any part is broken. If this is the case it should be replaced. See that the head is tight. Any looseness in the head of course will aggravate the chattering. Also see that both rubber buffers are in good condition. (3 and 4.) We do not think you will get any better results by changing your carburettor nor by reducing the compression. If you raise the cylinder heads by fitting a washer underneath the cylinders this will alter practi-

cally everything. As to whether the existing inlet rockers, etc., will suffice depends upon the degree by which the compression is reduced; in other words, it depends upon the thickness of the washer you fit and upon the amount of adjustment afforded on the rods. If you should decide to alter the compression we would advise you to place the packing under the cylinder base and not under the detachable head.

### Failure to Start.

**[?]** I had the spindle of my timing wheels break, and had it repaired and fitted it up again, but I could not get the engine to start.

I have set the exhaust valve to close at the top of the stroke, and the inlet to open immediately after, which, I think, is right; but I cannot understand the magneto. The points break and keep open until it has nearly turned right round. Would you be good enough to give me your advice on the matter?—C.P.

The valve timing seems to be correct, but you have to set the magneto so that the points are just about to break when the piston is on the top of the compression stroke with the spark two-thirds retarded. We think that if you set the magneto timing correctly the engine will give no further trouble.

### Storing a Motor Cycle.

**[?]** I should be very much obliged if you would inform me, through your valued paper, the proper way to prepare a motor cycle for storing it over the winter season. I mean, should the tyres be removed?—J.S.P.

We do not think that you need remove the tyres for storing for the winter, but if you should decide to do so the covers and tubes should be stored in a dark, damp place, such as a cool cellar. The tubes should be slightly inflated, or else carefully rolled up. With regard to the rest of the machine, you should

thoroughly clean it, and then paint all bright parts with either grease or thick lubricating oil. If the machine is stored with the tyres on, keep them blown hard and both wheels jacked up off the ground.

### READER'S REPLY.

#### Overheating.

With reference to overheating in a 2 h.p. Humber, in your issue of October 12th, "C.B." will probably find a long open exhaust pipe the best remedy. His jet, as you say, is too large and his gear too low.—C.D.S.

### RECOMMENDED ROUTES.

## The Canoelet

STANDS ALONE

— In splendid isolation the “Canoelet” Sidecar remains the perfect example of the engineers’ skill and the body-builders’ craft. Synonymous with comfort, “Canoelet” means all-round sidecar satisfaction, especially for the lady who has been used to riding in a car. She will appreciate the luxury of the “Canoelet.”

**MEAD & DEAKIN, Tyseley, BIRMINGHAM.**

# MISCELLANEOUS ADVERTISEMENTS.

## PRICES.

ADVERTISEMENTS in these columns—First 12 words or less 1/6, and 3d. for every two words after. Each paragraph is charged separately. Name and address must be counted. Series discounts and special terms to regular trade advertisers will be quoted on application.

Postal Orders sent in payment for advertisements should be made payable to **ILIFFE & SONS Ltd., and crossed**

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor St., E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

## NUMBERED ADDRESSES.

For the convenience of advertisers letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charge. Only the number will appear in the advertisement. All replies should be addressed, "No. 000, c/o 'The Motor Cycle,' 20, Tudor Street, E.C."

## DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged, when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

## SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

## DEFENCE OF THE REALM ACT

Under the provisions of the above Act, advertisers requiring workmen, and whose business consists wholly or mainly of engineering or the productions of munitions of war, or substances required for the production thereof, and whose works are situated within 30 miles of London, must include in every such advertisement the words, "No person resident more than 10 miles away, or already engaged on Government work, will be engaged."

Advertisers whose works are situated more than 30 miles from London can only have their announcements inserted with the approval of the Board of Trade, who will allocate to each advertisement a box number, and collect and distribute to the advertiser all replies received. The necessary forms of application can be obtained from any Labour Exchange or from the offices of this paper, and each advertisement must contain a clear reference to the effect that no person already engaged on Government work need apply.

## MOTOR CYCLES FOR SALE.

### Alldays.

ALLDAYS Matchless, speedometer, lamps; £20.—Warren's, 386, Enston Rd. Museum 3081. [4223]

COLMORE Depot, 31, Colmore Row, Birmingham, can supply immediately all models of Alldays Allon. [0796]

PETROL Free with Alldays Matchless, 4 h.p., 1915, clutch; 24 gns.—Troward, 78, High St., Hampstead. [4116]

1914 3½ h.p. 2-speed Alldays Matchless, enamelling and plating excellent; £33.—Parker and Son, St. Ives, Hunts. [4167]

1916 Allon, 2½ h.p., 2-stroke, condition as new, hardly been ridden; accept £37, no offers.—Cricketers, Downs Rd., Clapton. [3879]

PETROL Free with Alldays Allon, 2-speed, new January, perfect order; 27 gns.—Troward, 78, High St., Hampstead. [4115]

2½ h.p. Alldays Matchless, Villiers engine, 1915 2½ model, splendid condition; £18.—107, Wargrave Av., Stamford Hill, N. [3933]

1915 Alldays Matchless, 2½ h.p., very little used, like new; £20, or near offer.—Charlton Villa, Staines Rd., Bedfont, Middlesex. [4074]

ALLDAYS Allon, 1915, 2-speed clutch model, with accessories, £36/10; also 1915 single-speed, £29/10; liberal deferred terms.—Lamb's, 151, High St., Watlington, and 50, High Rd., Wood Green. [3951]

### Ariel.

ARIEL 3½ h.p., 2-speed free engine, in perfect condition; £12 cash.—Pudney, Walton-on-Naze, Essex. [X0390]

ARIEL 3½ h.p., mag. low frame, tyres, condition excellent; £18; after 3.—50, Fountain Hill, Stoke Newington. [3982]

1915 3½ h.p. Ariel, decompressor, lamps, horn, usual accessories, perfect condition; £27 cash.—Lloyd, Welland House, Spalding. [X0362]

ARIEL Combination, 3½ h.p., 3-speed, kick start, excellent condition; £35, or near offer.—A. Greenfield, 16, Temperley Rd., Balham. [4145]

1917 5-6 h.p. Ariels for immediate delivery; also 3½ h.p., with or without sidecars; deferred payments arranged.—Jones Garage, Broadway, Muswell Hill. [4199]

COLMORE Depot, 31, Colmore Row, Birmingham, have in stock for immediate delivery all models of Ariel motor cycles, with or without sidecars. [0797]

F. J. WATSON'S 1916 5-6 h.p. Twin Ariel Combination, in almost new condition, 3-speed gear box, h.b.c. clutch; £75.—30, Harvist Rd., Queen's Park. [4031]

2½ h.p. Ariel Motor Bicycle, very low, comfortable 24 little lat, mag. ignition, B. and B. carburettor, good throughout; sacrifice £13/10.—Beale, Chemist, 13, Crownhill Rd., Harlesden. [3986]

1916 5-6 h.p. Ariel Combination, almost new, all black finish, done 2,000, all possible accessories, in splendid order and condition guaranteed; £80; easy payments arranged.—Jones, Garage, Broadway, Muswell Hill. [3822]

### Arno.

ARNO, 1914, lamps, all complete; £20.—Warren's, 386, Enston Rd. Museum 3081. [4218]

### Auto-Wheels.

1914½ Auto-Wheel, very good condition, powerful; £7/10.—19, Stockwell Park Crescent, S.W. [X0158]

**Flat Twins.**

**W**E offer no apology for reverting to the subject of flat twins. This type of engine has lately come in for a good deal of prominence at our hands. Though a few years ago our references to the engine were just as enthusiastic as they are now, the amount of consideration given to the horizontal twin was not so pronounced as it must necessarily be to-day by reason of the attention it now commands at the hands of important manufacturers. Within the last month we have published detailed descriptions of three entirely new designs of horizontal twin-cylinder machines, but the majority of motor cyclists will not realise the full significance of this until peace returns.

We consider the present an opportune time for a review of current design, and in this issue illustrate no fewer than twelve different examples of flat twin-cylinder motor cycle engines of the four-stroke type, each accompanied by short specifications setting forth their particular features. The twelve specimens include all current types obtainable at the outbreak of war and the several recent additions, and particulars are also given of a thirteenth specimen representing the very latest arrival. To those anxious to become versed in the design and construction of the different types of flat twin-cylinders now on the market, we commend this review to special attention. As will have been gathered by observant readers, the flat twin is the most promising type of engine of the future. Important firms of long standing are now adopting it as their standard, and consequently it will not be out of place to recapitulate a few of the inherent advantages the flat twin possesses over other types of engines, though, of course, it has its counterbalancing disadvantages. It is a feature of flat twin engines that they seldom gum up. They are the easiest of starters, wonderfully flexible and efficient, and undoubtedly a good deal of this is due to the outside flywheel and its large diameter ren-

dered possible by reason of the fact that it is outside the crank case. Their perfectly even firing is well known, and is referred to in the article, whilst the mechanical balance is as good as can be with a twin. The early types of large flat twins seemed to possess a real weakness in the crankshaft, but latterly this objection has been overcome, and it is interesting to observe in this connection that, even in the small sizes, there is a growing tendency to offset the cylinders, so admitting of a straight thrust on the cylinder walls and at the same time much wider big-end bearings. The flat twin is usually of the square type, i.e., the dimensions of the bore and stroke are practically the same. The latest addition to the ranks of flat twins has, however, a comparatively long stroke, the ratio being approximately 1.35 to 1. As a result the performance of this new arrival is bound to create a good deal of attention, particularly in comparison with other engines of similar size in which a practically square (or 1 to 1) bore-stroke ratio is employed.

It is curious that the flat twin, which is one of the very oldest types of engines in use (we illustrate in this issue a flat twin made in 1895), should have jumped into popularity so suddenly. Its virtues were well known; and indeed the only representative of the type has for several years shown up very conspicuously in competition work both on road and track. For all that the design did not definitely attract other manufacturers until the last year or two, but now, as we have said, there are thirteen different designs before the public. Though never really in doubt, its future is now definitely assured, for the several leading manufacturers who have adopted it have demonstrated that it is regarded as one of the engines of the future. The various new arrivals bear added significance in view of the controversy in these pages on single v. twin. Undoubtedly the flat twin is a proved success, and will more and more command the attention of the motor cycling public.

## THROUGH FEMININE GOGGLES.

Autumn and Winter Riding Attire for the Lady Motor Cyclist.

**H**OW to clothe oneself most suitably to face the winter winds is a subject which must crop up periodically in the feminine motorist's mind, for with the approach of the colder seasons dust coats are ineffectual to safeguard us against the freezing temperature of the short dark days. I have during the past winters tried many of the motor clothing manufacturers' so-called "ideal garb," but my own experience teaches me that many costumes still leave much to be desired. One finds that dress for the lady rider is still only a partially solved problem, and is likely to remain so whilst its designers are not themselves practical motor cyclists. When motor cycling for women becomes as popular as it deservedly should, and the fashion artists are among the devotees, we shall be bewildered by the chic yet practical costumes from which we have to choose, but at present it is difficult, especially in winter, to obtain exactly the dress one would choose to wear.

### Feminine Love of Change.

Since, as we are told, the eternal feminine characteristic is love of change, one's ideals of last year are replaced by newer ones. For instance, last year I liked a stout cloth costume, an oilskin, a woollen cap and veil, and a pair of boots; but is always one to be so limited? This year I feel that the most practical outfit is one of the fashionable short skirts, a fur or fleece-lined coat, no longer than any woman would dare to wear at the present time, a little fur cap, the type to remind one of school days, and, instead of boots, a comfortable pair of stout brogued shoes and a pair of soft leather cloth-lined gaiters, reaching from shoe to knee. In such a garb one could defy the bitter cold, and on wet days one would only need to add a loose oilskin coat, a belt, and an oilskin hood such as I have described before. This should make one almost regardless of weather conditions.

### Ladies' Lined Leather Gaiters Wanted.

Most of our wants are catered for, but the cloth-lined soft leather gaiters I can find in no motor clothier's list, so until

front would be an advantage when riding a diamond-framed mount.

### A Useful Tip.

I remember in the old trial days on the occasion of one of the Woolwich Club's reliability tests amid the hills of Kent, Mrs. Hardee, of P. and M. fame, showing me how by a few buttons or snap fasteners at front and back she had converted an ordinary skirt into a most useful motor cycling dress, and I very much doubt now whether anyone has invented anything to beat it for simplicity and usefulness. Each winter we have heard much of the lady rider who puts her machine away carefully until the spring, but perhaps now that war work and more ardent duties are producing a hardier type of womanhood, this will be a thing of the past. There are many wintry days clear and bright for motor cycling. My own plan is to smear a little vaseline on the plated parts and then to use the machine all the winter through, giving it a good clear up again when the days begin to lengthen and the mud and slush are less plentiful. Now that a more generous petrol allowance is obtainable it would be indeed a sad and even foolish thing, from an economical point of view, to lay up one's steed in these days of few pleasures and scanty and poor train services even during the winter.

MAY WALKER.

A practical and becoming lady's riding outfit, consisting of a fur-lined coat, fur cap, fur gloves, and sensible yet fashionable short skirt.

### More about Two-strokes.

A Colonial reader complains that we are publishing very little two-stroke matter, and wants to know whether the British trade is going to follow the Hendee example, and jettison the two-strokes in favour of the miniature four-stroke twin. I should be mightily surprised if we did. We have had no serious trouble with baby two-strokes, barring overheated sparking plugs, and the new Sphinx igniter seems to have settled that hoodoo. *Pour moi*, I am still riding a baby two-stroke James, purchased in 1915, and if I say little about it, it is partly because it behaves so decently, and partly because summer roads tempt one to give the preference to heavier and faster mounts. As the mud comes out and the corners grow more permanently slippery the baby two-stroke gets the preference more frequently. Its handiness and slow speed make it an ideal winter mount; it needs no holding up, and it does not tempt one to go fast enough to freeze one's marrowbones. Above all, it possesses excellent engine balance up to thirty miles per hour, and balance is a point on which I have become a perfect maniac. I rather expect we shall hear a good deal about two-stroke twins in rather large capacities when the war is over; and the baby types should retain their popularity for all purposes where speed is not demanded. I daresay the new lilliputian flat twins of the A.B.C. and Hendee type will want watching, but none of the public can yet know how they will turn out in hard wear.

### My Candid Friend.

A candid friend has been "telling me off" on the subject of single-cylinders. He knows I keep a map with a red ink chart of my season's riding, and he asked to see it. After studying it, he remarked that it was easy to account for my predilection for the best balanced types of engine, because so much of my riding is fast work and on bad hills; and even he, though a pronounced single-cylinder enthusiast, does not profess to love either a one-lunger or a V twin raced hard on a low gear with a rigid form of drive. His arguments appealed to me so logically that I took out a belt-driven single-speed single-cylinder and an all-chain three-speed single-cylinder, and tested both very carefully on tolerably normal roads, both being types which I had tried in the balances and found wanting, so far as daily work in my usual district is concerned. I cannot say that I particularly appreciated the chain-driven three-speeder even on decent undulating roads, though it is a good example of its kind; but I must confess that I thoroughly enjoyed the belt-driver on Midland highways, and I am now ready to make the *amende honorable*, and confess that the nature of one's

locality is a weighty factor. In other words, a single-speeder is no good for a Lake District rider, and in such districts a three-speed single is tested at its very worst, because one is so often compelled to rev. it hard on the lower gears. If these conditions do not apply to a majority of British riders, they nevertheless apply to a fair percentage of those resident in the north and west, and they apply to perhaps the bulk of Overseas enthusiasts. Therefore they may have been worth stating.

### Coloured Lights for Cattle.

It will all depend on the "waving" or "swinging!" When I heard a wild rumour that the Government was about to compel cattle drovers to carry lights at night, I jumped on to my 16-20 h.p. Brooklands ported o.h.v. J.A.P. and simply hurtled to the office, where all the staff in turn wept tears of joy on my neck. We have never dreamt that any British Government could become so sane and logical in our lifetimes; and if it is honourable and all that to labour nobly for posterity, it is more satisfying to get one little slice of fat for oneself. After the preliminary enthusiasm had simmered down, I enquired anxiously, "What colour?" A perceptible chill fell visibly on the room. "Not *white*?" I murmured incredulously. But it was so. "They're to be 'waved' or 'swung' at the approach of any vehicle, you know!" reassured the chief. It is really too bad. How much waving or swinging will the average drover be capable of after rising at 4 a.m. to tramp to a market, loafing round the yard and surrounding pubs till about 6 p.m. and then padding the hoof with rather a fractions drove for another four hours or so? You cannot blame him, but I know the breed. He will give his beastly white lamp just one tiny waggle when I am a millimetre off impaling myself on the crumpled horn of—ugh! Gentlemen, they really might have made those lamp glasses blue or green; or I wouldn't have grumbled if they'd used the heather mixture which Mr. Solomon J. Solomon invented for the "Tanks." I speak feelingly, because only the other day I all but rammed a herd of bullocks which filled the widest of our British main roads from hedge to hedge; and I know that drover hadn't a waggle left in him, or he'd never have stood what I said to him, for I was angry and fairly fluent.

### IMPORTANT NOTICE.

#### GOODS MADE IN GERMANY.

The proprietors of this journal, being fully in accord with the recommendations agreed upon at the Paris Economic Conference, give notice that they will not permit the advertisements of new goods manufactured in enemy countries to appear in this publication, either during or after the war.

ILIFFE & SONS LTD.

## FLAT TWINS.

Some Observations and Comparisons in Design of the Various Specimens of Horizontally-opposed Twins fitted to Motor Cycles.

THE horizontal twin seems to be coming so much to the fore of late (*vide* the issues of *The Motor Cycle* for October 5th and 12th) that some observations and comparisons of the better-known makes will not be out of place. Two-stroke horizontal twins are not included in the present article, as they were separately dealt with on Feb. 17th, 1916; moreover, the flat twin is in its nature more suited to the four-stroke cycle, for this type of engine gives excellent torque, having one impulse in every revolution, and exceptionally good balance. In the case of the two-stroke, either both cylinders must fire together, necessitating a special magneto, or the balance must be sacrificed by utilising a single-throw crank instead of the 180° cranks invariably used, so making the pistons move together instead of in opposite directions for the sake of obtaining the more frequent firing impulses which constitute one of the advantages of a two-stroke.

There is, of course, no novelty at the present day about the horizontal motor cycle engine. The Holden motor cycle, one of the earliest designs, had an engine of this type, the connecting rods of which drove the small rear wheel direct, *i.e.*, without gearing. Later came the Fée, in 1905, afterwards called the Fairy, which was the forerunner of the Douglas, the machine to which the largest amount of credit for popularising this type must be given.

We have already mentioned the excellent balance of the horizontally-opposed engine. Readers who are interested in this subject are referred to three articles on "The Mechanics of Balancing," which appeared in *The Motor Cycle* on May 4th, May 25th, and July 6th; the instalment referring more particularly to the flat twin will be found in our issue for July 6th. It will be sufficient to remark here that the primary balance is well nigh perfect, but that a small couple exists in engines as usually constructed. This couple can be eliminated by fitting a three-throw crank to avoid off-setting the cylinders, but this adds complication. We may remark, however, that the less the cylinders are off-set, the smaller will the couple be. We will now deal briefly with some of the more popular flat twins in alphabetical order.

**A.B.C. 3½ h.p.,** THE A.B.C. engine, the design of Mr. 70×64 mm., G. W. Bradshaw, bristles with novelties and ingenious points. The cylinders are steel turned out of the solid,

with the fins placed circumferentially; the cylinder heads are cast iron. Contrary to usual practice, the exhaust valve is placed overhead instead of the inlet, the objects of this being to improve the cooling of the exhaust valve and to remove the exhaust port further from the cylinder, and thus give it a better opportunity of dissipating its heat into the atmosphere and the cylinder less cause for warping. Provided that this engine is properly lubricated (and lubrication is

3½ HP ABC.

3½ H.P. BRADBURY.

3½ H.P. BROUGH.

6 HP BROUGH.

**Flat Twins.—**

carried out by a mechanical pump) it is impossible to make it konk. Aluminium pistons are sometimes used. A Claudel-Hobson carburetter is fitted as standard, and the air entering this is effectively warmed by a pipe from the exhaust. The crank is in one piece, and yet the big ends are not split, for they consist of a specially designed roller bearing; these are threaded over the crank and the rollers placed in position afterwards.

**A.B.C. 2½ h.p.,** THIS is the smallest flat twin at 60×44 mm., present on the road, and weighs 14 lb. exclusive of the flywheel, magneto, and carburetter, which bring the complete weight to 27 lb. The general design is very similar to that of the 3½ h.p. A.B.C., and the exhaust valves are placed overhead as in the larger engine, but the cylinder head differs slightly, and the exhaust pipes are taken from the bottom of the exhaust ports instead of from the side. The pistons are of aluminium alloy. On a low gear of 11 to 1 it is claimed that this engine can attain a speed of 37 m.p.h., which means 5,500 r.p.m. The lubrication is by means of a mechanical pump. This little engine has been made principally for Government purposes, but it has been tested in a motor cycle with excellent results, and will be marketed after the war.

**Bradbury 3½ h.p., 68×68.7 mm., 499 c.c.** THE cylinder heads of the Bradbury are detachable, which enables the whole of the cylindrical part of the cylinder, including the horizontal cooling flanges, to be machined. The cylinder is then nickel plated to prevent rust. This gives it a very distinctive appearance. The valves are side by side and operated by adjustable tappets. A B. and B. carburetter is employed, and Best and Lloyd semi-automatic lubrication. The Bradbury flat twin was introduced just prior to the war, and only a limited number are in the hands of motor cyclists.

**Brough 3½ h.p., 70×64.5 mm., 497 c.c.** Two models of the 3½ h.p. Brough engine are manufactured, one being the racing engine, which is fitted with steel pistons and racing cams, but in other respects resembles the standard model. Both inlet and exhaust valves are placed in the head and operated by outside tappets and rockers. The valves are of large size with detachable ports; the exhaust port being provided with cooling flanges. The two-throw crankshaft is provided with balance webs, and carries a steel flywheel. The engine is secured in the frame by three bolts, and is easily removable, but the cylinders can be taken off without disturbing the engine when desired. Lubrication is by Best and Lloyd drip feed, and the oil is forced under high pressure to the big end bearing; the carburetter is an Amac.

**Brough 6 h.p., 70×90 mm., 692 c.c.** UNLIKE the 3½ h.p. engine of the same make, the larger Brough has side by side valves arranged above the cylinders—in fact, the cylinder is very similar in design to that of the 6 h.p. V twin previously made by this firm, from which it may be gathered that the cooling flanges are vertical. Roller bearings are used throughout, and not for the crankshaft only, the

2 1/4 H.P. INDIAN

6 H.P. MONTGOMERY.

8 H.P. WILLIAMSON W.C.

8 H.P. WILLIAMSON A.C.

result being a very smooth-running engine. Like its smaller brother, it is possessed of unusually silent valve gear. The 6 h.p. Brough is a war-time innovation, and has been designed to meet the demands of those who desire an efficient double-purpose mount. After the war the 6 h.p. Brough is bound to attract.

**Douglas 2 1/2 h.p.,** THE smaller Douglas has undoubtedly been the pioneer of "flat twins," and 60.5 x 60 mm., 345 c.c.

has been so successful for years that very few alterations have been required. Mechanically-operated inlet valves were fitted in 1912. The valves are now side by side and placed in a slanting position at the side of the engine and operated by adjustable tappets. The cooling flanges are cast longitudinally on the cylinders, and the crankshaft is balanced. One of the difficulties which have to be overcome in engines of this type is the lubrication of the front cylinder; in this engine it is accomplished partly by splash and partly by a small duct which is drilled in the crank case and cylinder base; this is situated just below the oil lead from the drip feed, and carries the oil straight to the front piston. A Douglas or Amac carburetter is usually fitted; the latter is provided with a jacket which can be heated by the exhaust gases.

**Douglas 4 h.p.,** THE larger Douglas model differs in 72 x 68 mm., several points of design from its smaller brother, the most noticeable being the mechanical lubrication system in which oil is carried in a sump below the crank case and supplied by a pump to the bearings and cylinders. This sump is provided with a window, through which the level of the oil may be readily ascertained. - The valve ports are of streamline form internally, which, of course, allows the gas to enter and escape with the utmost freedom, and the valves are placed side by side above the cylinders. The carburetter is a jacketed Amac heated by exhaust gases which are taken by a pipe from a point near the exhaust port and carried by another pipe to the silencer.

**Humber 6 h.p.,** WATER-COOLING is a prominent feature of the Humber sidecar engine. For 78 x 78 mm., 746 c.c.

for the sake of obtaining large bearings for the big ends and central bearings on the gudgeon pins the cylinders are placed rather more out of line than is usual. Another point of interest is the method of attachment of valves. These are side by side and carried in detachable pockets, which, when in position, are held firmly by a forked yoke, and a single bolt placed between the two valves. The advantage of being able to remove the seating and valves complete for cleaning and grinding purposes is very obvious. The carburetter is the Claudel-Hobson automatic.

**Humber 3 1/2 h.p.,** WE have described this entirely new engine fully so recently (October 12th) 68 x 68.75 mm., 497 c.c.

that a detailed account will be unnecessary here, and a few notes will suffice. No specimens are yet in public hands, though the model has been selected by one of the Allied Governments. Like its big brother, the 3 1/2 h.p. type has valves (inclined at an angle from the crank case to the cylinder heads) which are removable with their

**"Flat Twins."**

seatings, and large adjustable tappets are used. The starting handle operates through the camshaft. A Longuemare-Hardy carburetter is employed. The radiating fins are horizontal and very finely cast. The cool running of this engine can be ascribed very largely to the absence of valve caps which harbour heat.

**Matchless 6 h.p.,** This engine is the very latest addition to the ranks of flat twins. It is to appear on the 1917 model Matchless, but at present no illustrations are available. The length of the stroke of this engine is noteworthy (the usual flat twin is not far removed from the square). The lubrication of the engine is by an automatic forced system.

**Indian 2½ h.p.,** LIKE the 3½ h.p. Humber, the little 50.8×63.5 mm., Indian, introduced for 1917 and representing the only flat twin at present on the American market, has been dealt with in our pages within the last few weeks (October 5th). Up to the outbreak of war there were not many makers of the "flat twins" in this country, and they are even rarer in the States. In this case the valves are sloping, as in the 4 h.p. Douglas and Humber models, and neatly covered to exclude the

dirt. With the object of attaining equal lubrication in both cylinders, an oil duct is drilled from the crank case to the front cylinder.

**Montgomery 6 h.p., 75×78 mm., 688 c.c.** THE Montgomery was produced essentially as an engine for a sidecar outfit. The valves are placed over the cylinders, and are side by side. The cooling flanges are horizontal and nicely shaped. The split big ends are of rather unusual construction, being divided only on one side. The crankshaft and camshaft both run on Skefko ball bearings, a belt pulley of large dimensions taking the drive from the latter. The pistons are fitted with two rings, and the gudgeon pins are held in position by brass end cages. Lubrication is by splash.

**Williamson 8 h.p., 85×85 mm., 964 c.c.** THE last engine we have to describe is the largest flat twin at present on the motor cycle market. The Williamson engine is made by Douglas Bros., but it differs from the smaller Douglas engines in the fact that it is water-cooled, though air-cooled Williamsons have also been supplied. The valves are side by side, and placed at the side of the cylinder in a horizontal position. Either a B. and B. or Amac carburetter can be fitted.

## THE POST-WAR QUADRANT.

Some Advance Particulars of a Machine to embody Aero Engine Practice.

IF any confirmation were required of the recent articles in *The Motor Cycle* wherein we referred to the way in which war-time developments in aeroplane engine design might have a bearing upon the future design of motor cycle engines, we cite a recent conversation we had with Mr. T. Silver, of the Quadrant Co. The Quadrant firm is one of several motor cycle manufacturers who have been engaged for some time past on aircraft engine parts, and will, it is hoped, be able to give motor cyclists the benefit of these experiences hereafter.

Like other motor cycle firms, the company is wholly employed on Government work, but intend as soon as pre-war operations are resumed, to introduce a new engine, the point of which will be the embodying of experience gained in the manufacture of aeroplane engine parts. This applies more particularly to the design of the cylinder and piston. These components will be extremely light; the cylinder walls, for instance, will in parts not exceed 2 mm. in thickness. Experiments have been made with an aluminium alloy piston provided with bushings for the gudgeon pin, also with the top webbed, but it is not yet settled whether this will be standardised.

### A New Pattern Gear Box.

Exhaust and inlet valves will be constructed of special nickel steel combining extreme lightness and long wearing qualities. Of other details, a new design of three-speed countershaft gear box of the Quadrant Co.'s own manufacture will be introduced for this model, and the experience gained with the patent vaporiser recently described has led the firm to standardise it and to be prepared to fit it to all models. The usual size of jet used on the Quadrant

single-cylinder is a No. 40, but it has been found that, in conjunction with the vaporiser, a No. 29 jet passes quite sufficient fuel, with the result that 25% greater distance can be covered on the same quantity of petrol and without any loss of power.

Although the firm expect to produce this machine at a price to meet the demand for a low-priced reliable mount, it is advisable to point out to our readers that it will be useless for them to write to the company at present for either prices or particulars. The above is merely an outline of an enterprising post-war policy.

### MOTOR CYCLIST CONSTABULARY.

E. H. Self and his colleagues in the blue uniform of the London Special Constabulary. The sidecar (an 8 h.p. Chater-Lea) has frequently been requisitioned in the execution of duties, and often carries a load of four or five passengers at those times.

# A HOME-MADE SIDECAR OUTFIT.

Design and Details described by the Builder.

FROM time to time I have noticed and been immensely interested in motor cycles built at home. Encouraged by the successful attempts of others, I have produced a sidecar outfit which gives the greatest pleasure, some of which is contributed by the knowledge that the machine was practically all "home-made." There is a particular sense of satisfaction in accomplishing something which thousands never attempt and willingly pay for dearly, and possibly the details I give of my machine may interest readers with shallow purses.

S. Holt's home-made sidecar outfit.

It is my own design, and took me in my spare time, from the commencement of making the drawings, making patterns, and fitting together, some eighteen months.

This has been made possible by having a small lathe and workshop at home in the cellar, and also the use of a larger lathe for some of the heavier work.

I made patterns for all the frame lugs, which were cast in steel, bored them out, and brazed the tubes in. All the tube bending I did myself, including the front forks. The wheels I built on Chater-Lea disc hubs, the wheels being fitted with 2½ in. Palmer Cord tyres. The links on the front forks are fitted with eight Hoffmann ball bearings in order to reduce wear to a minimum. The front brake (horseshoe) and the back brake (band) are also of my own make and design.

The band of the rear brake can be parted at the back to allow of the easy withdrawal of the back wheel without disturbing the operating mechanism, the brake being operated by a pedal on the right-hand footboard. The shoes of the front brake, by simply unscrewing two nuts, can be slipped down the front fork, on which they slide, and swung round, thus allowing the easy withdrawal of the front wheel without detaching or disturbing the horseshoe.

The tank I made myself out of 20 gauge tinned steel, but had it enamelled at a shop, as I did not feel equal to making a decent job of the lining, although I enamelled the rest of the frame.

## Boring the New Cylinder.

The engine was an old Excelsior engine of, I believe, M.M.C. make, which I had previously run solo in an old Rex frame. The old cylinder being somewhat badly worn, and the exhaust valve seating cracked, I designed a pattern for a new one, making it as big as possible to fit the old crank case. The engine is now 89 mm. bore x 86 mm. stroke. I got this cylinder cast by a well-known firm in Birmingham which specialises in this class of castings. I bored it out myself and made the piston and rings for it. Although the cylinder was only bored out and finished off the tool, and not ground out, after I had run it about fifty miles I could not pull the engine over compression.

The gear is of the variable type, and consists of a double expanding countershaft pulley, which can be moved toward or away from the engine as desired, thus altering the gear, as has been frequently illustrated.

The gear in itself works very well, but I cannot get a belt to stand on the front owing to its short length (12 in. centres). I am now, after twelve months, abandoning this gear in favour of a four-speed gear box, which I have designed and am now making. I have already cut all the gear wheels, and had to rig-up the tackle myself for doing it on the big lathe before mentioned. The drive will be chain-cum-belt, and I shall fit a Coventry silent chain on the front and a 1½ in. belt on the back. I am going back to the old-fashioned cone clutch, as I think this type gives the most satisfaction for hard and constant wear.

The handle-bars are of the V shaped type, with all the control wires enclosed, all the control levers being made by myself. Both tool boxes are made of 20 gauge tinned steel and lined with felt to prevent rattling.

The sidecar chassis, also of my own design and make, has a four-point attachment, and is attached to lugs integral with the frame. The sidecar wheel has an outside support, the hub being a Chater-Lea disc hub with hollow spindle and a bolt.

## A New Fuel—Paraffin and Water.

It will be observed that there are two temporary tanks on the main tank, and motor cyclists will be interested to hear that I am successfully running on paraffin and water, with petrol to start up on. I bring all the air to the carburetter (Senspray) through the exhaust box. A pipe (1½ in. diameter) enters the exhaust box, passes through and out of it, and is taken to the carburetter, the portion between the carburetter and the box being lagged to prevent any cooling of the air. By this means all the air taken in has to pass through the exhaust box, and in a few minutes I can hardly bear my hand on the carburetter. I naturally found that the engine knocked on hills when using paraffin—and knocked badly, too. A friend of mine suggested the injection of water into the cylinder, so I made a small automatic inlet valve (½ in. diameter) to take the place of the usual compression tap fitted in the top of the cylinder. From one of the tanks on the top (filled with water) a pipe is led to this small inlet valve. The flow of water is regulated by means of a needle valve fitted on the side of the tank. The engine, when using paraffin, does not knock on the level, but on going up a hill it starts knocking. As soon as I turn on the water the knocking ceases, and the engine is very much more flexible than with petrol, the engine pulling away on top gear, similarly to a steam engine, without any sign of labouring. So successful is it that my friend and I have protected its use on cycles and cars, and intend getting it put on the market.

S. Holt.

M.M.C. engine with m.o.i.v. and automatic valve for the admission of water. This latter takes the place of the compression tap, which can be seen higher up on the pipe.

## NOTES ON NEW MODELS.

### IVY NEW MODELS STILL FAR DISTANT.

THE Ivy Motor Cycle Works of Mr. S. A. Newman, Lichfield Road, Birmingham, are still wholly occupied upon munitions at the present time, and no motor cycle work at all is being done. Developments which the makers have in mind only for a later period have not reached the experimental stage, so that even an outline of a new model might be very far from the mark and even misleading.

### AN IMPROVED NORTON CYLINDER.

IMPROVEMENTS in the cooling and construction of air-cooled cylinders are always of interest. Therefore, when a drawing of a cylinder which Mr. J. L. Norton, of Norton Motors, Ltd., has designed, was shown to us recently, we obtained permission to give readers of *The Motor Cycle* an outline of its principal features. Briefly described, the new Norton cylinder for the big four and the 3½ h.p. will have radiator ribs, which, in the horizontal plane, are set slightly eccentric to the cylinder barrel. This will allow a greater depth of rib where the cylinder is likely to get hottest, thus preventing distortion.

To prevent ringing the horizontal ribs will also be joined up vertically, i.e., the interstices between the ribs will be filled up at certain points by vertical ribs of the same thickness as the horizontal ones. Where the horizontal ribs are intersected by the valve springs the ribs will be extended partly to encircle the springs, so that, by revolving the engine to lift a valve and then inserting a small tool which lodges between the ribs, a valve spring can be held up while the valve cotter is extracted.

The port design will be altered, and the combustion chamber of the 3½ h.p. model will be slightly modified to give a more even flow to the gases.

With regard to the development of piston design, the model which will be adopted is that having six webs at the top. In our sketch we have shown diagrammatically how first of all four webs were tried, but as this design caused distortion of the piston top it has been decided to adopt six ribs to prevent any inequality in contraction or expansion of the metal. Two or three different designs were tried before the six rib model was finally adopted. Mr. Norton explained to us that the success in power and speed of the Norton engine has been brought about almost entirely by strict

attention to what appear to be minor points in design, but which really affect the power output of the engine to an enormous extent. Riders of Norton machines may rest assured that no stone will be left unturned to effect these engine improvements, which are the production of an engineer who is always endeavouring to provide a little more power and efficiency by detail alterations in design.

### A.J.S. TWINS FOR THE FUTURE.

MESSRS. A. J. STEVENS and Co., Ltd., of Wolverhampton, have obtained a great reputation for their three models—the 2½ h.p. single and the 4 h.p. and 6 h.p. twin—but they have always shown a marked preference for the twin. It will be recalled that the single-cylinder machine ridden by Eric Williams won the Junior T.T. Race in 1914, yet the firm have never looked upon the single as a permanent feature of their programme, and we were not, therefore, surprised to hear that they will discontinue its manufacture after the present stock of parts is exhausted, and concentrate upon twins.

The 2½ h.p. mount has many admirers who will express disappointment at its disappearance. This decision is in accordance with the belief, which the makers firmly hold, that the twin engine is an infinitely better mechanical proposition, and will undoubtedly supplant the single-cylinder in public favour in time to come. This opinion is interesting in view of the recent articles in this journal, emphasising the fact that the single-cylinder, whilst being quite satisfactory in every other way, cannot compare with a well-balanced twin engine for comfort and smoothness of running. An expert rider with youth in his favour, it is pointed out, will put up with the snatchy action of the single to obtain a little greater efficiency, but the average rider appreciates the steady pull of the

twin engine, and it is to the "average rider" that we must look for the future.

As regards the 4 h.p. and 6 h.p. models, Messrs. A. J. Stevens and Co. do not propose to effect any striking alteration to the 1916 design, and it is expected that prices will remain unaltered. Government work occupies practically the whole of their time at present.

### A SPRING-FRAMED TWO-STROKE LIGHTWEIGHT.

ONE of the smartest lightweights we have seen is the two-stroke Allon de Luxe model, illustrated herewith. It has been completed to the order of a doctor at Wincanton, Somerset, who will use it as a tender to his four-seated car. The most interesting feature—the spring frame—was described and illustrated in our last issue, page 381.

The two-stroke engine has a bore and stroke of 70×76 mm., 292 c.c., whilst a two-speed countershaft gear, box and a handle-bar controlled clutch are embodied in the design. The mudguarding is well carried out, and the leg-guards should be very efficient. It is hardly necessary to emphasise the importance of a doctor having a motor cycle that is well guarded; next to reliability this is most important.

The detail work is well thought out, an example being provided by the small guards over the front and back drums. Finished in grey and lined to match, the *tout ensemble* is very pleasing.

This machine has been purchased—as the direct result of the splendid running of a standard model Allon in the hands of another member of the same family. The standard model has stood gruelling Government work without a murmur for some months past, and is still going splendidly. Naturally, the spring frame machine is more comfortable, and the owner of the original, who took it down by road to Wincanton, found it compared very favourably with the standard machine to which we have just referred.

A fine example of a British two-stroke design—the new Allon de Luxe, with spring frame and special mudguarding.

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelopes, and should be kept distinct from questions bearing on technical subjects.

### Magneto Angle.

**?** I have a twin engine with cylinders at 50°, and a magneto which is at 48°. Would you kindly let me know if they will run together?—A.E.C.

It is better to have a magneto of the same degree as the cylinders, but a 48° magneto will run a 50° twin quite well.

### Auto-wheel Licence.

**?** I have a tandem cycle and a juvenile sidecar attached, and find I want a little help on hills. Do you consider an Auto-wheel would be of any service to me, and also would the cycle tax of £1 be legal; having four wheels?—W.H.P.

An Auto-wheel should be of assistance to you. The licence would be £1, payable on the Auto-wheel, a 5s. driving licence, and 5s. for registration, but in some districts a four-wheeler tax may be demanded.

### Overheating.

**?** I have a 2½ h.p. two-stroke, and would be grateful if you would tell me the reason why, when I run a few miles and the engine gets heated up, it begins to lose power, and in taking a hill will stop, but will easily climb almost any hill starting cold. I may mention that it is lubricated with an oil and petrol mixture.—J.B.R.

The trouble is overheating, which may be caused by the use of too large a jet, or through using an unsuitable plug, thus causing pre-ignition; this might also be caused by carbon deposit. Possibly you do not mix sufficient oil with your petrol.

### Lightening Pistons.

**?** I have got a 1914 3½ h.p. New Hudson and three-speed hub gear. I find that at present the piston is very heavy. I wish to lighten it so as to obtain the fastest speed without weakening it too much. (1.) What weight ought I to take out of the piston? (2.) Should I lighten the flywheels correspondingly? (3.) What timing would be suitable for fast work solo, and occasionally with sidecar?—D.G.D.

You are not likely to be able to lighten the piston sufficiently to make much difference to the speed. (1.) All you can do is to drill some holes in the skirt, but this must not be weakened too much. (2.) Yes, the engine must be properly balanced by an expert. See special article in "Motor Cycles and How to Manage Them." (3.) We should advise you not to alter the maker's timing, as you require the machine for two purposes.

### Petrol on a Four-stroke.

**?** I have purchased a 1913 Douglas. Last leave I filled a two-gallon petrol tin with a 50% petrol and paraffin mixture with oil, as I was then riding a petrol lubricated two-stroke. (1.) Can I use this petrol mixture on my Douglas? (2.) Will it make any difference to the plugs, lubrication, carburetter, etc.? (3.) Are exhaust whistles any good as row-makers?—E.E.S.

(1.) The mixture could be used all right on your machine. (2.) It would make the outside messy—but would not necessarily affect the plugs or the lubrication, except that you might do with a little less oil through the lubricator. It might be desirable to use a larger jet. (3.) An exhaust whistle is quite good as a means of giving "audible and sufficient warning."

### Mysterious Refusal to Start.

**?** During last winter I had the cylinders, carburetter, etc., down and gave them all a thorough clean out, also the tank. After I had put it together again I could not get a sound out of it. I went carefully over everything again. Eventually I took off the top of the carburetter and took out the float, and tried it again. It went off the first turn of the handle. On putting the float back and screwing the top on, silence reigned supreme again. I have had this trouble more or less during the whole of this year, and so far have not been able to cure it. I have tried bending the petrol pipe, so that all the curls in it slope downwards. I have made the little dome on top of the carburetter, in which the top of the needle goes, perfectly smooth, so that there are no ledges for it to jam against, and yet it behaves as if the needle gets stuck in two positions. Without any apparent reason it will suddenly begin to lose power and quickly stop, unless I slam the throttle wide open, when it will pick up again, and I can then usually put the throttle and air levers in the normal position, and it will run steadily for a few miles, and then start slowing up again. On the other hand, occasionally in making a stop, if I do not turn the petrol off, the petrol will run out of the main air intake.—N.A.P.S.

Your trouble is undoubtedly a very curious one, and without actually seeing the machine is difficult to explain. It certainly looks as though the trouble is in the carburation. See that the carburetter is perfectly clean, and also that the air vents in both the float chamber

and the petrol tank filler cap are quite clear. These being choked might account for the machine running when the float chamber cover is removed. See that the collar on the needle valve which regulates the petrol level is quite tight, and does not permit the level to vary, sometimes being too high and sometimes too low. Is the needle bent by chance? It might also be well if you went carefully over all ordinary adjustments, such as seeing whether the valve clearances are correct, valves closing properly, contact breaker points making proper contact, plug in good order, and so on.

### Misfiring when Warm.

**?** My mount is a 1915 W.D. pattern 2½ h.p. Douglas. After riding a few miles at a fair speed, it will suddenly start firing on one cylinder and stop. At a minimum speed of about ten to fifteen miles per hour it is all right. When it has stopped I allow a few minutes to cool, start away, and the engine fires as regularly as clockwork. The plugs have been changed, the magneto, carburetter, and lubrication have been checked, and found to be in order.—J.T.

Evidently you are using a plug which is not suitable for the machine, and possibly the plug you have substituted is equally unsatisfactory. You should use a good single or double-point plug with fairly substantial electrodes. Also carefully examine your valves, and see that they are closing properly. It is possible that when the engine becomes overhot one of the exhaust valve stems may extend and not allow the valve to close. This would account for the misfiring of which you complain.

### Petrol System.

**?** I possess a 2½ h.p. two-stroke motor cycle, with drip feed lubrication to the engine. This I find unsatisfactory, and have taken to mixing the oil with the petrol, but am uncertain as to the amount of oil to mix with one gallon of petrol. I should be obliged if you would inform me; also if this method of lubrication is satisfactory.—C.A.B.

The petrol system of lubrication is probably the most satisfactory way of lubricating a two-stroke. The one disadvantage is its messiness. A good point, however, is that the oil supply increases as the throttle is opened wider, and the engine given more work. The proportion is roughly one part oil to fourteen parts petrol. A half-pint to a gallon should be found about correct. If the engine smokes continually, too much oil is being supplied, and the proportion should be cut down slightly.

## ANOTHER SPRING FRAME.

### ADAPTING FRONT FORK METHODS TO REAR SPRINGING:

**S**TILL another extremely practical and interesting system of rear springing for motor cycles is shown in the accompanying illustrations. It is the

Details showing double spring coupling.

joint invention of Mr. F. J. Richardson and Mr. Downs, both leading lights in the motor cycle trade. It will be seen that the system is practically an adaptation of the Brampton front fork to the rear of the cycle. We are now using a Hobart two-stroke fitted with this form of rear springing, and in the course of a short initial trip have been impressed by the simplicity and light weight of the construction. The springing is neatly adapted to the rear as follows: The top spring links are attached to the uppermost point of the triangulated rear portion of the frame formed by the chain stays and two additional stays. The springs are fitted on the moving top links as in front fork practice, two being arranged to take the main shocks and two the rebound.

One great advantage is that it does not necessitate any great alteration to existing frames, and it is capable of being easily applied to any regular type of frame. The triangulated rear portion of the frame is pivoted at the back of the gear box bracket, while the apex is attached to the centre lug of the spring couplings. This gives a considerable range of movement, whilst side play is practically impossible, owing to the distance apart at which the spring couplings are set, and the width of the lower hinge. It has the peculiar advantage of being also adaptable to ladies' models—a feature which has not been possible with many designs of spring

The new spring frame, shown fitted to a standard and a lady's frame.

frames. This frame is still undergoing tests, having been in use for nearly 1,000 miles, and it is now also being tested by a well-known Midland motor cycle firm. So far it has given complete satisfaction, and no doubt, when certain details have been settled upon, it will come before the public as one of the simplest solutions of the difficult problem of rear springing.

A new type of spring frame which has had a thorough testing on a Hobart lightweight.

## ANOTHER BRITISH MAGNETO.

**A** NEW works solely devoted to the manufacture of magnetos has lately been installed by the Fellows Magneto Co. at Cumberland Avenue, Park Royal, Willesden, N.W. At the present time the factory is engaged purely on turning out magnetos for the Government, but after the war a speciality will be made of motor cycle magnetos of all types.

Messrs. Fellows have been associated with the repair of magnetos and ignition appliances for the past twelve years, and their name is not unknown to readers of *The Motor Cycle*. They started in quite

a small way in Hertford Street, Mayfair, and have gradually increased their business until it has assumed its present proportions. We have inspected the work turned out in the new factory, and can assure our readers that it is of the best and most accurate description.

## PUBLIC SCHOOLS M.C.C.

**W**E had an interesting conversation the other day with Cpl. H. B. Browning, R.E., a member of that very live body in peace time, the Public Schools M.C.C.

Browning joined in October, 1914, having been working with Pauling and Tamplin guarding a certain telegraph wire. Shortly afterwards these men interviewed the C.O. at —, and were taken by him as despatch riders, Browning eventually going to the Front, where he has been for eighteen months. Another man who was with Browning was Bertram Fowke, the rider of a Blackburne, who also became a despatch rider. Another member of the P.S.M.C.C., Victor Dreschfeld, together with some others of the club, enlisted in the Buffs. Dreschfeld was the rider who had a bad spill during the last P.S.M.C.C. speed trials at Brooklands. While at the Front Browning rode a 1915 4 h.p. Triumph, about which he was very enthusiastic. He has come home to train for a commission in the Gunners.

The day after meeting Cpl. Browning we were rung up by the brothers Burney, who both now hold lieutenants' commissions. Alec is in charge of a motor cycle repair base in France, and Cecil is running a repair shop for electric lighting sets attached to a signal station. Many of these outfits are driven by air-cooled horizontal twin engines, which, having to work under a continuous heavy load for long periods, have given a good deal of trouble. The newer sets are provided with flat twin water-cooled engines with much enlarged crankshafts, and these are standing up in the most exemplary manner. Both the brothers Burney are extremely fit, and are very glad to have obtained their ten days' leave at the same time.

## A Circular Route Round London.

A New Road which will link up Existing Main Roads.

**S**INCE it is a recognised fact that after the war the labour market will be flooded, the Government is shortly to be asked to facilitate the preliminary measures for a great scheme of main roads round the Metropolis. The idea is no new one, and has had the attention of the principal motoring organisations for some considerable time. With this scheme in view the Royal Automobile Club made an excellent map of roads round London about three or four years ago, which has been of great value, and will continue to be until some such scheme as that we describe below is carried out. The Road Board has also had the matter in hand.

The main features of the proposals are dealt with by Mr. W. R. Davidge, F.S.I., in *Land and Water*. The proposed roads, including 51 miles of existing roads, have a total length of about 130 miles, of which about 109 miles pass through open country and about 21 miles through built-up property.

### Two Circular Roads.

Briefly, the main proposals are: A north circular road round the north of London from Kew Bridge,

round to Leytonstone, *via* Ealing Common, the Welsh Harp, Hendon, Palmer's Green, and Edmonton, linking up all the main roads; and on the south of the river a south circular road, formed by linking up and improving existing roads from Woolwich to Clapham Common, passing on the way Catford, Forest Hill, Dulwich Common, andulse Hill.

Other proposals are: A new main road westwards, a new main road eastwards, a new main road northwards, and another south-westwards to Chertsey. By-pass roads or loop roads at Brentford and Croydon are already arranged for, and other or loop roads are proposed to avoid Romford, East Ham, Eltham, Bromley, Sutton, Kingston, and Kingston Hill.

Proposed circular route round London. The thick double lines show the new plan suggested by the Local Government Board and the Board of Trade, and drawn up by the Royal Automobile Club.

Two important internal improvements are proposed, one from Essex Road to Lea Bridge Road, which will give a badly wanted new outlet to the north-east, and one from City Road to Hackney Road, to connect the proposed eastern and western avenues *via* the Euston Road, and thus form a new way right across London.

## Lubrication and External Cleanliness.

A Plea for a Smooth and Unobstructed Crank Case.

**O**NE objection I have to mechanical lubrication with external pump is that it renders the engine very difficult to clean. Not only do the pump and its connections afford a multitude of nooks and crevices in which dirt and oil can lodge, but it is almost impossible to get at the aluminium casting behind them. If the dirt is allowed to accumulate for any length of time, the oil dries into a hard brown coating over the face of the metal, as difficult to remove as a coat of paint, and the task of thoroughly cleaning the engine is then a matter of an hour or two. Unless the job is done very thoroughly the clean patches merely show off the dirty ones about the numerous inaccessible corners, and one wishes one had left things alone, and gone on pretending the crank case was not made of aluminium at all.

The only way to keep a crank case with these external fittings at all presentable is to scrub it with paraffin once a week, so that the oil has no time to dry on, but we would much prefer a clean, smooth

casting which can be neglected for weeks in the knowledge that it will brush up clean and white when, say, the machine is to be sold.

### The Ideal.

There is no doubt that external cleanliness and smoothness of finish influence the mind of the average rider more than he thinks, and though mechanical lubrication is much preferable to the hand pump, the external variety will not, probably, live very long. The proper place for any such fitment is obviously inside the timing case, and personally I look forward to the day when, on our heavy touring machines, we shall simply pour oil into a well, cast integral with the crank case—as on the Velocette, Douglas, and one or two other machines. This system is by far the cleanliest and simplest—no oily accumulation of grit about the tank and lower portions of the machine owing to careless garage boys, and *no curly oil pipes* to look bad and get in the way.

H.M.B.

#### CLASS A MEN IN THE M.T.

WE are advised by the War Office that Class A men are not excluded from the Mechanical Transport Section of the Army Service Corps, as stated in our issue of the 26th ult.

#### Y.M.C.A. IN NEED OF MECHANICS.

A NUMBER of first-class mechanics are urgently needed to aid the work of the supply department of the Y.M.C.A. in France, Salonica, and Mesopotamia. They appeal to discharged soldiers, or any other men over military age, or otherwise unfit for service in the ranks, to help in their great work of keeping the supplies going to help our gallant troops. The address of the secretary is c/o. Motor Dept., Y.M.C.A., Tottenham Court Road, London, W.

#### PHOTOGRAPHS OF THE "TANKS."

THOUGH photographs of the heavy armoured cars—"tanks," "land-ships," "Willies," or whatever the reader prefers to call them—have not yet been published in this country, we are advised that the first real photographs of them reached New York on the 17th ult. An American's comment on them is "that there is something suggestive of pre-historic times about the beasts." Is it not strange that pictures which are banned in this country find their way to America and are exhibited there without restraint? This surely is not the way to keep secret information from the enemy.

#### FROM MOTOR CYCLE TO STEAMSHIP.

DURING the week we had the pleasure of receiving a call from A. V. Sumner, the well-known exponent of Zenith motor cycles in trials previous to the war. He is now, and has been for some considerable time, an engineer on board a transport steamer. At present he is enjoying a few days' leave in England, after a long voyage in the Mediterranean, at the conclusion of which he had the unpleasant experience of being torpedoed. He was in the engine room at the time the ship was struck, but was, however, lucky enough to secure a place in one of the boats, and was just congratulating himself upon his good fortune when the wash caused by the sinking of the steamer capsized the boat. Luckily they were in fairly populous waters and were soon rescued. His new rôle, he tells us, does not include easy work, and he would not much care to continue at it after the conclusion of the war. When not on duty there is nothing left to do but eat and sleep.

#### MOTOR CYCLIST TRANSFERRED.

SEC.-LT. W. D. SOUTH, Royal Warwickshire Regt., T.F., has been transferred to the Royal Flying Corps as a third-class Equipment Officer. South is the well-known Midland motor cyclist who scored successes on Rudge and Scott motor cycles, but latterly seen in competition on a Grand Prix Morgan.

#### A PHOTOGRAPHER WOUNDED.

Pte. L. R. Manner, a former assistant on *The Motor Cycle* photographic staff, who enlisted in the early days of the war, and has been in Gallipoli, Egypt, and France during the last two years, is now lying in the General Hospital, Nottingham, suffering from the effects of a bullet which penetrated his stomach and back.

#### ANOTHER MOTOR CYCLIST HONCURED.

Lt. R. N. C. Usher with a friend about to leave Buckingham Palace on his motor bicycle after being decorated with the Military Cross by the King. Lt. Usher, Wilts Regt., attached to the R.F.C., attacked three hostile machines and drove them off. On another occasion he fought five hostile aeroplanes, and, although hit in the leg, continued to fight until his engine stopped. He then succeeded, under great difficulties, in reaching an aerodrome, where he collapsed through loss of blood. The friend looks as if he were indicating that the front tyre was flat, but gallant officers recently decorated with the Military Cross do not worry about such details.

### TIMES TO LIGHT LAMPS.

#### GREENWICH TIME.

Nov. 9th	...	...	4.49 p.m.
" 11th	...	...	4.46 "
" 13th	...	...	4.43 "
" 15th	...	...	4.40 "

### The Show.

The 1916 show—which opens to-morrow (Friday)—will go down in history as an exhibition for second-hand vehicles. It is an excellent idea, and certainly the only form of exhibition possible in war-time.

### A Progressive Colonial Club.

We have received a copy of the 1916-17 handbook of the East London (S.A.) Motor Cycle Club. It contains an amount of information of interest to local riders, and its compilation reflects credit on the hon. secretary, Mr. H. Whitby. At the time the booklet went to press thirty-five members of the club were on active service.

### The L.C.C. Licences.

Recently a statement was made that the L.C.C. is issuing driving licences at the rate of well over one thousand a week. This naturally upset the newspaper group which published the information, but we give them credit for withholding comment until the facts were verified, though we fully expected to see them publish further comment on pleasure motoring. In 1915 the L.C.C. issued nearly 15,000 more licences than in 1914, but this year the number promises to decrease a little. A representative of the *Daily Mail* was told that the increase was chiefly due to the numbers of women who are learning to drive, and that more cars are used for military purposes, and, in addition, many young officers are buying motor cycles for their personal use.

### Cattle at Night.

The A.C.U. on several occasions has for some years past been urging the various local county councils to make a regulation demanding that all drovers of cattle carry lights, but with the result that they were laughed to scorn. It is exceedingly gratifying to know that such a regulation has now been made law as well as the Order causing all vehicles at night to carry a red lamp at the rear. These were two points which motorists were very anxious to see made law in times of peace, and it seemed well nigh hopeless that they would ever be brought into force. The war has done some good after all, and we sincerely hope that these regulations, which safeguard the interests of *all* users of the road after dark, will become permanent institutions.

### Pushing Unlighted Cycles.

The latest regulation respecting pushing an unlighted bicycle, viz., that such a proceeding is not illegal, provided that the machine is kept on the extreme left-hand side of the road, does not seem to have penetrated to the "West Country," for a cyclist was fined 5s. for this at Crownhill Petty Sessions last week.

### Motor Cyclists immune from Accident.

We read in the daily press that during last quarter 227 accidents to individuals caused by vehicles in the streets occurred in the City of London. The number includes the following: 84 were occasioned by horse-drawn vehicles, 5 by tramcars, 80 by motor cars, 35 by motor omnibuses, 2 by motor cycles, and 2 by ordinary cycles.

### Naphthaline Balls.

A correspondent tells us that in the early and hot part of August he rode from London to Bristol, thence to Liverpool, around Lancashire, and back to London *via* Coventry. On the outward journey he used a mixture of petrol and paraffin and six naphthaline balls to the gallon. At Liverpool, after a successful run, he took down the engine and found very little carbon deposit, and that soft enough to be wiped off with a cloth. On the return journey he used the same petrol-paraffin mixture, but without the balls. The engine ran badly, so much so that he had finally to resort to pure petrol. The carbon deposit was plentiful, hard and brittle, and was only removed with considerable difficulty. The road conditions were more severe on the outward journey.

### SPECIAL FEATURES.

FLAT TWINS.  
AN ILLUSTRATED REVIEW.  
VOLUNTEER MOTOR CYCLISTS.  
THE "SECOND-HAND" SHOW.

### Overseas Motor Cycle Corps.

We hear from a reader in Ceylon that a military motor cycling corps has been formed by order of the General Officer Commanding at Kandy, Ceylon.

### Stolen Machine.

An all-black Colonial model 2½ h.p. Douglas, two speed, T.T. bars, year 1915, has been stolen from Chiseldon Camp. Engine and frame number 25,608, C.A.V. magneto, Amac carburetter, with black despatch box on rear carrier. The registration number is AM 6487. On the top tube in yellow paint is painted "W.D., 23,081 G." Any information respecting this machine should be sent to Capt. H. M. Thomas, A Lines, Army Cyclist Corps, Chiseldon Camp, Wiltshire.

### The Lighting Regulations.

A correspondent draws our attention to the reply to "W.G.S." on page 359 of our last issue, wherein it was stated that within six miles of the sea anywhere in the United Kingdom, or within six miles of navigable waters of any estuary, it is required that a cap or disc of opaque material must be placed over the glass in addition to the one thickness of ordinary white tissue paper. This statement does not apply generally. The additional cap or disc is only required in the *Eastern* counties.

A "flat twin" of 1895. The horizontally opposed air-cooled engine is not a recent invention, as will be seen by the illustration, which shows the first Wolseley car built—a three-wheeler.

**Sidecars in Official History.**

In Vol. IX. of "The Times History of the War" there are two photographs taken on the occasion of the sidecar outing into Surrey arranged by the Harley-Davidson Motor Co. for heroes of the Jutland battle.

**No More New Motor Cycles.**

The new Order prohibiting the manufacture of motor vehicles was not entirely unexpected. It must be noted that the assembling of machines is also forbidden.

**A Starting Tank.**

With reference to the starting tank illustrated and described in our last issue, on page 391, a correspondent tells us that a friend of his fitted a similar device to an old machine a year or so ago, but something went wrong, and it exploded. In this case, however, the tank was fitted to the cylinder head, and so, doubtless, became very hot, which probably made all the difference.

**Volunteer Motor Cyclists.**

Motor Cyclist Volunteers had a great time last week-end. Field-Marshal Viscount French inspected one section, and others indulged in manoeuvres. The exclusive photographs in our centre pages this week will interest all supporters of the Volunteer movement.

**Automatic Inlet Valves.**

Several letters have been received in reply to the request of a correspondent for suggestions regarding the leakage of gas past his automatic inlet valve. Some of these appear on another page. Further suggestions, which we have not space to print in full, are that the valve stem may be riding on the guide and thus preventing the valve from closing; that the valve head may foul the plunger in the inlet pipe, with the same result; that the stem may be bent; and, lastly, that the seating should be built up by acetylene welding faced up and reground. One reader offers to cure the trouble if the valve is sent to him.

**Special Features.**

An especially interesting and instructive article in this week's issue describes the many and various makes of flat twin motor cycle engines. A dozen photographs are reproduced by which comparison can be made.

**The Show.**

At the beginning of this week there were sixty-four motor cycles entered for the Second-hand Show at the Agricultural Hall, Islington, which opens to-morrow (Friday), and will remain open until Saturday, the 18th inst.

**The National War Funds.**

At the week-end the principal war funds stood as follows:

The National Relief Fund (distributed £3,474,475) ..	£5,971,911	0	0
The British Red Cross Fund ..	4,954,176	2	9
Tobacco Fund ..	118,012	0	0
The Queen's Work for Women Fund ..	170,852	13	10

**Average Prices.**

We give below the average prices of second-hand models offered for sale in *The Motor Cycle*. Where it is possible to obtain a sufficient number of each model the average for the past week is quoted, otherwise the last average is given, if within four weeks:

Make.	Year.	H.P.	Average for last week.	Latest average obtainable.

**Lighting Regulation Booklet.**

The booklet giving details of the lighting regulations, which has been issued for some time by the Automobile Association for the convenience of its members, has now been revised, and in simple language the lighting restrictions existing all over the country and including the Metropolitan area are now given. Members may obtain a copy free by application to the Head Office, Fanum House, Whitcomb Street, London, at the same time quoting their membership numbers. Any motorist non-member may also obtain a copy upon application if two penny stamps are enclosed to cover cost of postage.

## NO MORE NEW MOTOR CYCLES.

### New Order Prohibiting Manufacture of Motor Cycles or Cars without a Permit.

ON Monday last an important Order was issued by the Press Bureau to the following effect:

The Minister of Munitions hereby gives notice that, in exercise of the powers conferred upon him by the Defence of the Realm (Consolidation) Act, 1914, the Defence of the Realm (Amendment) No. 2 Act, 1915, the Defence of the Realm (Consolidation) Regulations, 1914, and all other powers thereunto enabling him as from the 15th day of November, he hereby prohibits until further notice any person, firm, or company engaged in the manufacture or repair of any vehicle designed for mechanical transport or traction, or any part of such vehicle, from carrying out in any factory, workshop, or other premises without a permit issued under the authority of the Admir-

alty, the Army Council, or the Minister of Munitions, any work consisting in the manufacture, assembling, or erection of any new or unused motor, internal combustion engine, designed or adapted for mechanical traction, or of any new or unused motor cycle, motor chassis, motor waggon, or of any tractor or other motor vehicles of any kind propelled by mechanical means, subject, however, to the following exception:

Work required to complete contracts placed by the Admiralty, the War Office, the Minister of Munitions, or an Allied Government, on or before the date of this Order.

**Commentary on the New Order.**

The new Order does not come as a real surprise to manufacturers, so that it is

not so drastic as at first might appear to be the case. There are very few new motor cycles being assembled nowadays, and the majority of machines made have been despatched Overseas. The references to 1917 models which have appeared in the press are more 1917 models in name than in reality, as in some cases they are no other than 1914 designs masquerading as "new" models. Several entirely new designs have, of course, been produced, but these are usually solitary specimens of the proposed post-war model of the manufacturer concerned. For some time past there has been a good deal of heart-burning in the trade, the works of some firms being controlled by the Government, whereas their rivals were able to produce motor vehicles in small quantities—these remarks apply to the car as well as the motor cycle trade. The new Order will put everybody on a fair basis.

## The Show of Second-hand Motor Cycles.

**E**NTRIES are still coming in rapidly for the Second-hand Show. We may remind our readers that the show will be open from November 10th to the 18th. The cost of entering the Agricultural Hall on Friday, Monday, and Tuesday will be 2s. 6d. up to 5 p.m., and after that hour and all other days, including the first Saturday, 1s. The show will remain open from 10 a.m. till 9 p.m.

The motor cycle exhibits will be arranged on the outer ring of the central group of six stands, and will be classified in alphabetical order according to make; for instance, Ariels, Alldays, etc., will form one group, while B.S.A.'s, Bats, Bradburys, etc., will form the next, and so on.

Entries (25s. for motor cycles) will be received up to the day the show opens, between the hours of 8 a.m. and 4.30 p.m., at the Bedford Street entrance, Liverpool Road, Islington, N. All exhibits should be clean. No petrol, oil, or carbide may be brought into the hall, but if an exhibitor desires to reserve the amount of petrol in his tank he should provide a can for that purpose which may be stored for him in a special shed. Spare parts or tools should be placed

by the owner in the store provided so as to avoid loss during the show.

The machines exhibited may be insured against burglary, larceny, and theft at the rate of 3s. per cent. (minimum 3s.) Details of the scheme can be obtained

How the Second-hand motor cycles and cars will be staged at the Agricultural Hall Show, which opens to-morrow.

from Mr. Glass, Lincoln House, High Holborn, W.C.

We learn that the well-known motor cycle expert, Mr. R. G. Mundy, has been appointed to examine and inspect the motor cycle and cycle car exhibits.

### LIST OF MOTOR CYCLES ENTERED FOR THE SHOW.

The list shows the number of the different makes of machines entered, and when a 1916 specimen is to be represented, that fact is stated:

A.J.S.	One 6 h.p. 1916 model.	..	..	3
ALLON	One 2½ h.p. 1916 model.	..	..	2
ARIEL	..	..	..	2
B.S.A.	..	..	..	4

COVENTRY EAGLE	One 2½ h.p. 1916 model.	..	..	1
DOUGLAS	..	..	..	2
ENFIELD	One 6 h.p. 1916 model. One 3 h.p. 1916 model.	..	..	3
EXCELSIOR (AMERICAN)	..	..	..	1
EXCELSIOR (BRITISH)	..	..	..	1
HARLEY-DAVIDSON	One 7-9 h.p. 1916 model.	..	..	4
HENDERSON	..	..	..	1
HUMBER	..	..	..	3
INDIAN	One 1916 Powerplus model.	..	..	4

#### THE BRITISH MAGNETO AND "THE MOTOR CYCLE."

Those motor cyclists who have the interests of their country at heart will be interested in a booklet which will be ready shortly, reviewing the efforts of "The Motor Cycle" in fostering a British magneto industry. It is well to recall that "The Autocar" and "The Motor Cycle" were the only two journals which, BEFORE THE WAR, openly exposed the fact that the British motor trade was entirely dependent upon German magnetos. We shall be pleased to supply a copy of this pamphlet to any motor cyclist who cares to make application to the Editor.

### A LONG DISTANCE DESPATCH CARRYING TEST.

**D**URING the present war motor cycles have undoubtedly come into their own, and by their great utility have practically proved themselves indispensable for modern warfare. Quite apart from belligerent countries, neutrals also realise their military value, and we continually hear of the motor cycle sections of neutral countries being perfected. A most interesting and arduous military motor cycle test is to be carried out

shortly by the United States military authorities, in order to show the utility of the motor cycle as a message carrier and a rapid means of transport. The test is to be made with a motor cycle and sidecar, and will consist of a journey from McAllen, near the Mexican frontier, to Albany, New York, a distance of, roughly, 2,700 miles. The test will be for the purpose of carrying a message from Maj.-Gen. O'Ryan, of the New

York National Guard, now at the Mexican front, to Governor Charles Whitman, of New York. The machine will be mounted by two men, who will be equipped as for field conditions with full kits, each weighing 50 lb.; camping necessities will also be carried. The total load, including passengers, will be over 469 lb., so with the rough roads and tracks likely to be encountered the outfit will certainly receive a severe test.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

#### Automatic Inlet Valves.

Sir,—In answer to "L.F.I.'s" query relating to automatic inlet valve leaking between valve and seating, I have experienced the same trouble with valves, both in steam and petrol engines, and solved the problem by converting the seatings from bevel to flat face; the leakage will then cease. The trouble is caused by contortion when the cylinder gets heated.

GEORGE LEWIS.

Sir,—In reply to "L.F.I." re automatic inlet valves, there is probably a slight distortion of the valve seat when screwed into the cylinder. A method which effected a cure in my case was, if, as is usual, the inlet is over the exhaust, to remove the exhaust valve, screw the inlet valve, and cage with some grinding compound on the valve face into the cylinder, and grind in with a screwdriver through the exhaust valve guide.

J. A. ROBERTSON.

#### American Motor Cycles.

Sir,—I should like to reply to the letter by "J.W." in *The Motor Cycle* for November 2nd re American machines, and to point out that his argument is based upon the depreciation which has taken place in machines since 1915. This offers no comparison between the lasting qualities of British and American motor cycles. It is after a machine has seen four or five years' hard service that the workmanship put into British machines shows up. Personally, I have been riding a 1904 Rover lightweight during the recent summer holidays, and have covered nearly 2,000 miles without a single breakdown, with the exception of the ignition, which is by coil, etc. The machine will climb all but the very worst hills, and the speed is over 45 m.p.h. Whoever heard of a twelve-year-old American machine which had not fallen to pieces years ago? Usual disclaimer. J. W. MORRIS.

#### Will the Single-cylinder Survive?

Sir,—I have read with great interest the correspondence in your columns on the subject of single v. twin. May I, as an all-weather sidecarist, be allowed to make a small contribution to this controversy? Some of your correspondents who champion the cause of the single for solo riding appear to think that the heavy twin is the only suitable machine for serious sidecaring. I would like to point out that this is not by any means the case. Both single and twin have their allotted positions as sidecar machines, and the one will not efficiently perform the work of the other. To pull a sidecar satisfactorily the engine of a motor cycle must be kept in good tune, and the time spent in cleaning, adjusting, and keeping in tune must necessarily be greater in the case of the twin than the single—since the former has a greater and more intricate surface to be cleaned and more working parts to adjust than the latter. This fact persuades me that as sidecar machines both single and twin will survive, each in its own sphere. The man who sidecars principally for pleasure usually has plenty of time to devote to his engine and machine between his various outings. The machine for such a man is the big twin. Were I in the position to give plenty of time to my machine I would use an 8 h.p. twin and a luxurious heavy sidecar. The comfort of such an outfit well repays the time spent in keeping it in good order. On the other hand, there are many men who, like myself, use their machines every day in all weathers, because they have to, and who have very little time to devote to cleaning and tuning. So for such a man the single is, in

my opinion, far more suitable than the twin. All the time I can spend on my machine for cleaning and tuning is about a couple of hours once a week. But I require a machine that will start at the first kick every day, and take me in pouring rain over third-class roads suffering from the attentions of the motor transport lorries. Moreover, my outfit must be such that if I wish to drive a passenger 150 miles on pleasure bent I can do so without fatigue or discomfort to myself or passenger, and without being ashamed of the appearance of my mount. I have found all my requirements in a big single and sidecar. With the little time I can spare I could not keep a twin in such tip-top order as I do my big single, which I consider the ideal mount for my purpose—fitted, of course, with all-enclosed chain drive and ample mudguards. My present machine, a 4½ h.p. James and sidecar, is among the first of its class, and will, I think, with similar machines by reputable makers, remain the choice of the busy all-weather sidecarist.

H. V. TATTERSALL.

#### A Six-stroke Cycle.

Sir,—Your comments on the letter of your correspondent who writes from H.M.S. *Diana*, and the various letters of late on the steam motor cycles, suggest to me a six-stroke engine. It would have the usual valves timed to give induction, compression, power, scavenging, conventionally as with a four-stroke, but followed by the introduction of a few drops of water pumped into the hot cylinder at the top of scavenging stroke by a small pump worked by a suitable cam. This water should flash into steam and give an extra power stroke, which, followed by second scavenging stroke, gives us a cycle of operations in which we have two power strokes out of six, i.e., one in three as against one in four as at present.

I am quite prepared to hear that this idea has already been patented by, say, "Bill Adams" in the early forties, and that it was tried and rejected by Noah on a trial trip preceding his well-known voyage. Nevertheless I submit the idea for what it is worth.

G.H.

Mitcham.

[A six-stroke cycle is not new, but we have never heard of it being carried out exactly as suggested.—Ed.]

#### Running on Paraffin.

Sir,—A paragraph in your issue for November 2nd has prompted me to "rush into print."

I have now done over 2,000 miles on my 1910 single-gear Triumph on a home-made tin carburettor, using paraffin and water (a small amount of petrol is used for starting).

I have come to the following conclusions:

1. That water is absolutely indispensable when using paraffin (especially at full throttle).
2. That to warm the fuel, or the mixture, is a mistake in an air-cooled engine.
3. That if the correct amount of paraffin (for combustion) is introduced there is none left to dilute the oil.
4. That paraffin requires a larger jet than petrol.
5. That float chambers are out of date on motor cycles.
6. That paraffin and water is faster on the level than petrol, but slightly inferior on hills.
7. That one's engine is always cool and eager on paraffin and water.

I heartily agree with "Ixion" on flat twins. You should hear me curse my own single—the barbaric spoke smasher! Sheffield.

O.B.H.

### The Scott Sociable.

Sir,—As an interested reader of your paper, may I be allowed to pass one or two remarks with regard to the Scott Sociable, which I have seen alternately commended and depreciated in your columns?

In my opinion the *main* fact of the popularity of the sidecar has been overlooked, it being assumed that comfort and appearance are the only things to be aimed at. On the contrary, I think that the Scott Sociable has no advantages over the light car except that it is *minus* one wheel and none of the advantages of the sidecar. The points in favour of the sidecar are:

(1) The sidecar can be detached if necessary and the motor bicycle used as a solo machine, with a corresponding decrease in running expenses (probably the first reason why the sidecar as such was introduced).

(2.) Where the average person is concerned, all houses have not a large enough side entrance or passage to admit of such a wide machine as the Scott, whereas a motor bicycle can be detached and taken in separately.

Also I believe that many people would prefer rather a machine like a Morgan runabout, which, after all, is practically the same type as the Scott (and much neater looking), or else improve the Scott as your correspondent Sgt. S. Way suggests in his letter.

RFN. W. C. CLARKE,  
5th City of London Rifles.

### Inlet Pipe Connections.

Sir,—In your issue of the 12th ult. I note that "Ixion" is interested in the several methods of attaching inlet pipes in twin and multi-cylinder engines. Perhaps he and some of your readers would be interested in the accompanying sketch of the way the inlet manifolds are connected on the Beardmore aero engines. This method is also used on the exhaust manifolds on that engine, and for the inlet manifold of one of the R.A.F. productions.

If it is found suitable on aero engines, where insulating tape is not tolerated, it surely should be the best and simplest method for use on motor cycles.

There is something to be said also for the coned seating, which does not require a washer if the faces are properly ground in in the same manner as a valve.

It is often used for inlet valve seatings, and would probably work well if used on the induction pipe itself.

ALEC H. JENKINS,  
F.-Sgt., R.F.C.

### Boycott of German Goods.

Sir,—In the concluding paragraph of the letter under the above heading, which you were good enough to publish in your issue of August 17th, I invited each one of your readers in sympathy with the object referred to to send me his, or her, name and address, stating if willing to join a league, either run as a separate body or, preferably, linked up to the A.C.U., and I stated that if the response were adequate further steps would be taken in the matter without delay. I have taken no further steps in the matter up to the present because, as a matter of fact, the response, though interesting, did not seem to me sufficient to warrant any such steps being taken. It is true I have received a number of letters expressing strong sympathy with the views set forth in my letter, and promises also to join any league which may be formed. It may interest you to know that these letters have come, not only from all parts of the kingdom, but from such a far-off land as Japan.

As I say, however, the total number is disappointingly small, and, indeed, suggests that motor cyclists as a body are extremely apathetic and, one might almost venture to say, selfishly indifferent in a matter of this kind; yet it surely cannot be that they are really indifferent: rather perhaps that they are merely thoughtless in the matter.

Does anyone to-day doubt the necessity for a definite boycott of German-made goods? If that be granted, does

BR8

anyone question that no such boycott can be brought about except by co-operation and by the strong pressure of public opinion? If this too be granted, is there any simpler or more effective way by which to achieve our purpose than by the formation of such a league as I suggested? This league should be so constituted as to appeal to every patriotic motor cyclist in the kingdom, and, indeed, as one of my correspondents suggests, it might include the pedal cyclists also.

Any such organisation is, of course, dependent upon the energising influence of one or two individuals, and in these days it is difficult to find the right kind of man to organise such a league having the time at his disposal for the purpose; that was mainly my reason for suggesting that it might be taken up by the Auto Cycle Union or some such existing organisation, and run in connection therewith at a nominal fee, instead of the ordinary A.C.U. subscription.

Unless the writers object, I propose, therefore, in the course of the next month, to hand over the letters I have received to the secretary of the Auto Cycle Union with a view to his endeavouring to arrange a preliminary meeting of those interested. May I make a final appeal to your readers to send in their names at once, in order that they may be invited to any preliminary meeting which may be arranged?

BRITISHER.

London, E.C.

### Electric Lighting for Motor Cycles.

Sir,—I, in company with many others, am glad to see that publicity is being given to this subject, for electric lighting is bound to oust acetylene, as it has practically done on motor cars.

Your correspondent, unfortunately, said very little about dry battery lighting, and, with your leave, I should like to give one or two conclusions drawn from experiments.

I have found the best battery for the purpose to be the Hellesen (catalogue price 6s. 6d.)  $4\frac{1}{2}$  volt, its recuperative powers being astounding.

Your article advocates a 4 volt 3 c.p. bulb for the head lamp, but in these days of reduced lighting, why waste 3 c.p. against tissue paper, when 1 c.p. without tissue paper (in the London area) and with the lamp tilted down has been giving satisfaction for six months or so? Moreover, two bulbs of 4 volt 0.3 amp., 1 c.p. (approximately), can be run for an hour per night off a Hellesen cell for at least a season, provided the light is switched off immediately it is not required.

I should like to add that I have no connection with A. H. Hunt and Co., the importers of the Hellesen cell.

L. W. E. HURSLEY.

### Bearing Pressures.

Sir,—“A.A.S.’s” article on this subject strikes me as an ingenious attack upon the long-stroke engine, based largely upon premises which are not necessarily correct; and even upon his premises I disagree with most of his conclusions. Taking these in order:

Page 334. 1. The hearings of a long-stroke engine can be as large as in a medium or short-stroke if a piece is taken out of the flywheel rim; but why not have a larger flywheel?

2. The long-stroke bearing will have a shorter distance to travel if the bearing is smaller (for the swing of the connecting rod can be neglected), these distances being  $\frac{3}{4}$  in. and  $1\frac{1}{4}$  in. per revolution.

Page 335, first column, 1 and 2. Neither of these statements would be true if the connecting rods were both of the same length in proportion to their stroke, say, five times the crank throw.

Another point: a long-stroke engine having a greater leverage at its crank can be geared higher, and consequently need not turn over at the same speed. Also, given a certain speed of crank pin, the longer the radius the less the pressure of the unbalanced force. “A.A.S.” seems to suggest the opposite in the last column of the article, although he does not actually say as much.

Finally, may I say that I hope Mr. Norton or some other long-stroke exponent will put the case for the opposite side? Personally, I have an open mind on the subject, and am willing to be convinced either way, but “A.A.S.’s” article is not convincing when it is examined carefully.

JOHN BONYTHON.

# THE LITTLE WORD *Bates* ON TYRES

*means big things  
like this!*

This is the original Bates,  
the finest tyre for hard  
work yet produced.

Perth, Western Australia.  
Gentlemen,—I feel I must write and let you know the wonderful wear I have had from a set of your 26×2½ in. Bates Tyres. After a varied experience of eight different makes on many Motor Cycles during the last nine years, I was forced to the conclusion that no tyres were much good. In November, 1914 (on the advice of a friend), I had Bates Tyres fitted to my new mount. The machine has now been used for sixteen months, and the tyres are a treat to see. This is a unique experience for me, for I have always had to purchase new tyres every 8 or 9 months, the heat and bad roads here always "settling" them in quick time. I am so delighted with my first experience of Bates Tyres that in future I will see that my machines are always equipped with your excellent tyres.

Yours sincerely, C.F.K.

This is only one of many proofs of the growing popularity of Bates Tyres, the increased output of which has enabled the makers to reduce prices, in spite of the higher cost of materials!

*Riders should lose no time  
in sending for our New List.*

NEWCASTLE: 28, Clayton St. West.

## A NEW M.C. COAT.

It is essential that you should protect yourself against the vagaries of the weather.

Dunhills' New M.C. Coat will prove an excellent weatherproof for your tour.

It is made of proofed twill with a lining of oil cambric, and is thus impervious to any weather.

A detachable fleece lining is very fashionable with many motor cyclists. It is most useful during the climatic changes at this period of the year.

PRICE £3-15-0

## The "KAY" patent Quick & Easy Starter

for use with Petrol Substitute and Heavy Fuels. Will start your engine immediately on the coldest day and when the engine is warm enough it automatically takes up the running on the heavy fuel.

### Points.

Engine will start on coldest day.

No draining of carburetter.

Satisfaction guaranteed.

### Points.

Prevents Petrol substitute from passing into base chamber, thereby allowing perfect lubrication.

Price low.

### Testimonial.

Lancaster, Oct. 17th, 1916.  
I am delighted with your Quick Starter. Kindly send me another as soon as possible.—Yours, W.J.

By the use of the "KAY" Patent Starter there is absolutely no necessity to turn off your main fuel supply tap, drain your carburetter, or prime your cylinders with petrol. You cannot be held up in traffic as the Starter immediately comes into operation if the heavy fuel ceases to act. It is impossible to start from cold on petrol substitute and therefore absolutely necessary to have a Starter even if you already have a vapouriser, as heavy fuels cannot be vapourised until the engine is warm.  
Easily fitted to any make of Machine in a few minutes.

Price complete ready for fitting, 15/-,  
or for fitting to any existing auxiliary tank, price 7/6.

Further particulars from sole makers:

**KAY & SONS, Halliwell, BOLTON, LANCs.**

**Carburettor Improvement.**

Sir,—I enclose herewith a sketch of a simple fitting to a standard Triumph carburettor which has been made and tried on six machines at the Front with every satisfaction. These results are greater economy in petrol and an increase in speed—conflicting claims, I know, but let anyone who doubts try it first and express an opinion afterwards.

Sketch of carburettor improvement referred to in letter.

It should be of special interest to the writer of "1,500 Miles on a Military Mount."

The fitment consists of a piece of  $\frac{5}{16}$  in. to  $\frac{3}{8}$  in. copper tube bent to the required shape and soldered to the carburettor body as shown, holes being first drilled to suit. The air slide must be shortened  $\frac{5}{16}$  in. at the top to allow of further movement, and the control wire will need adjustment too. This will make it impossible to close the air right down, but such a position is never necessary.

With the slide in its normal position the action of the carburettor is not

altered in any way, but it will be found that when the engine is turning over fast it will take more air, and this can be given by raising the air slide above its normal position, and thus allowing dilution of the mixture by air passing down the  $\frac{5}{16}$  in. pipe already mentioned. I can guarantee that anyone taking the trouble to fit this addition will find it worth while.

A further alteration, which I find convenient, but not necessary, is to change over the wires on the ignition and extra air levers so that the throttle is on one side and the extra air on the other.

Perhaps I had better mention that the jet on the machines tried with this device is No. 29.

B.E.F.

J. C. HUDSON (Lt.), C.A.S.C.

**Sidcar or Cycle Car?**

Sir,—I thoroughly agree with Mr. F. E. Cooke in his commendation of the big twin combination for the family man. I had much the same experience as he: running a  $3\frac{1}{2}$  h.p. single for some years, "smelling" at a cycle car, and finally getting a 7.9 h.p. Harley-Davidson with a two-seated G.K. sidcar. I find that by the use of a simply-made arrangement, carrying three little seats *à la* toboggan, I can take my wife and four children quite comfortably without using the pillion. I am using Binks, but find that I can do practically every hill on top gear, which is something under 4-1, a steady 30 m.p.h. being the most comfortable driving pace. My tyres are 28x3in. Goodyears, which, after over 1,000 miles in very bad weather, are absolutely unscratched. The great comfort of the reserve power can only be appreciated by anyone who has had a good deal of the "run alongside to ease her on steep hills" sort of thing. My  $3\frac{1}{2}$  h.p. having a fixed gear, I did this oftener than I cared for. I have not yet got my carburettor properly tuned up, but I get 47 to 50 m.p.g., but will, I know, do better than that. The tractability and flexibility of the big outfit must be experienced to be believed. I use Ambroleum in the gear box, and find an ordinary icing-syringe, kept filled and hung upside down, a very simple means of filling. I find the three-speed countershaft very easy to manipulate, but always declutch (as with the H.D. one must) when changing.

WALTER ROSE.

**Overheating and Sparking Plug Design.**

Sir,—Referring to your correspondent's suggestion in your issue of October 26th under the above heading, it is interesting to observe that he is simply putting forward the features which have been embodied for years in the special racing model Lodge plug

The drawing (fig. 1) of the old Lodge T.T. or racing model shows the radiator at the terminal end, the stout central electrode with the minimum of surface exposed to the heat of the combustion chamber, and the gradual increase in its diameter from sparking to terminal end.

Fig. 2 is an illustration of the present-day Lodge racing plug (model K), and it will be seen at once, on referring back to your correspondent's "proposed design" and comparing the two, how closely his radiator and terminal resemble those used in the Lodge racing plug, a plug which is, as you know, in general use, especially on high-speed motor cycle engines.

THE LODGE SPARKING PLUG CO., LTD.

F. B. LODGE, Director.

[Our contributor did not overlook the excellent Lodge plug, but his idea was to carry the matter further and make the fins appreciably deeper.—Ed.]

Sectional view of the old Lodge T.T. (fig. 1) and the new model K plugs designed for racing engines.

**Public School Orderlies.**

Sir,—I thought that the enclosed photograph of some of the motor cyclist orderlies at the Public Schools O.T.C. camp in the South might be of interest to you. Eton, Westminster, Marlborough, and Bradfield all provided orderlies. The photograph shows three Marlburians in uniform and myself (Westminster) in "change." Except for an Indian, a Zenith, and three Douglasses, everyone rode good old  $3\frac{1}{2}$  h.p.'s, which seemed much the most popular. I do not think anyone had any trouble, bar punctures.

T. M. KER.

Orderlies attached to the Public Schools O.T.C. Camp. The photograph shows three Marlburians in uniform and Mr. T. M. Ker (Westminster) in "change."

## PATENTS.

Abridged by ERIC W. WALFORD,

### A Fork Springing System.

The movable fork is attached to the steering column at the top by plain links and at the bottom by a system of links in the form of a closed four-sided figure. Movement of the fork in relation to the steering column would, of course, distort this figure, and consequently the movement of the fork is resisted by a pair of springs which bed against an abutment on the steering column. The result is that the fork is permitted both a vertical and a limited horizontal movement. As an alternative, the compound links may be arranged at the top and the plain links at the bottom of the head.—A. H. Culley and S. Davies, No. 12,977, 1915.

### A Compression-operated Lubricator.

Of the two illustrations the upper represents the operating mechanism of a lubricating pump, whilst the lower shows the pump itself. The pump spindle carries a ratchet wheel actuated by a pawl which is reciprocated by a valve rod working in a chamber which screws into the cylinder head, and is therefore exposed to the pressures in the cylinder. The chamber is provided at each end with a valve seating, and the valve head is of double cone formation, so as to

engage either seating. The lower seating is adjustable to vary the stroke of the valve rod. Each time that the pressure in the cylinder rises sufficiently to lift the valve the ratchet wheel is rotated, and by this rotation it actuates a pump

plunger through the medium of the eccentric shown. The pump chamber is supplied with oil, which, on each forward stroke of the plunger, is forced past a ball valve to a pipe leading to the desired point, e.g., the crank chamber. It would apparently be necessary to provide the oil supply pipe with a non-return valve to prevent the oil being forced back to the source of supply instead of passing to the engine.—D. McGregor, No. 13,768, 1915.

### A Spring Hub.

In order to obtain resilient suspension, the hub shell is arranged to run on eccentric side plates, which are secured together by bolts, enabling the bearings to be adjusted. The plates are free to rock on an eccentric sleeve mounted upon the fixed spindle, and at their centre is secured a cranked shaft, the ends of which project outside the plates and are

attached to radius rods pivoted to the frame of the machine in such a manner that the plates, and consequently the hub shell, always move in a suitable path. Between the crank pin and one of the attachment bolts for the side plates will be seen a curved blade spring, which is deformed when movement takes place, and which tends always to return the parts to the normal position.—J. Martin, No. 12,774, 1915.

### Components Employees' War Relief Fund.

We continue to hear splendid reports of the various war relief funds organised by the employees of the big concerns (the small firms doing just as well proportionately), and the employees of Components, Ltd., have recognised the needs of the men at the Front and the wives left at home, in a practical manner. They have sent 2,000,000 cigarettes out and numerous parcels. About eighty families receive regular weekly allowances. Up to date £2,000 has been collected and dispersed. On the roll of honour are 350 names of the men who have enlisted, and it is gratifying to find among them a holder of the Military Medal—Gnr. T. Holmes, who before the war was employed in the finishing shop.

## SPARKLETS.

### Changes of Address.

The Lodge Sparking Plug Co. are now located at St. Peter's Road, Rugby.

The vendors of Grandex motor cycles have moved to larger and more commodious premises at 349, Euston Road, N.W., than those previously occupied by this firm.

Messrs. W. and A. Bates Ltd., have removed the Glasgow depot to 24, Carlton Place, which is within a stone's throw of the old address.

### Sphinx Plugs.

The new catalogue of the Sphinx Manufacturing Co. will give readers all they want to know concerning Sphinx sparking plugs. It will be ready this week, and can be obtained on application to the makers at Bradford Street, Birmingham.

### Stock of Parts.

Messrs. J. B. Brooks and Co., Ltd., Great Charles Street, Birmingham, whose enormous factory and extensions are almost exclusively devoted to Government work, can still supply ordinary customers with many articles from stock where such stock permits. A special stock list can be obtained on application to the manufacturers.

### Joseph Lucas, Ltd. Second Interim Dividend.

Owing to the urgency of war work and the depletion of the staff for military service, it is found impossible to prepare the usual balance sheet. The firm have no doubt, however, that a profit has been earned, and they have declared a second interim dividend on the ordinary shares of 7½%, less income tax, making, with the dividend already paid, 10% for the year ended August 31st last.

### A Nutritive Drink when Winter Riding.

It is a difficult matter, occasionally, to obtain a suitable drink when on a cold winter's ride—one that is both stimulating and nourishing. Horlick's malted milk is a preparation that exactly meets that requirement, being a combination of pure rich, full-creamed milk, to which is added the nutritive extracts of malted barley and wheat. It is obtainable in tablets, which can be dissolved in the mouth as required, and being so extremely portable should appeal particularly to motor cyclists.

### Air-cooled Plugs.

The makers of the Apollo plugs, the Apollo Manufacturing Co., Moseley Street, Birmingham, have secured the sole manufacturing rights throughout the world for the Watkins air-cooled sparking plug. This plug has a large hollow central electrode, divided in two in such a way that a current of air can circulate through it and so keep it cool. The body of the plug has radiating fins as well to assist in cooling. Although the main output of these plugs will be for aeroplane purposes, they will be developed for other engines as early as possible.

# THE AUTOMOBILE ENGINEER

**Every  
Motor Cyclist**  
should draw upon  
this Storehouse  
of Motor Cycle  
Knowledge.

“Hints and Tips for Motor Cyclists” contains what may be termed the cream of all motor cycling knowledge up to date.

The book gives hundreds of useful “wrinkles” and little items of information concerning the running, management, and repairs of motor cycles, culled from the experience of many years of riding, and covering every detail of the machine.

The arrangement is simple and straightforward and reference is simplified by an extensive index and marginal subtitles on every page.

*Invaluable to  
the new rider*

## The Fifth Edition

Revised, Enlarged, and  
brought up to date.

Contains over  
400 separate  
paragraphs.

No matter what type of machine is used, this little book will be found of the greatest service to every rider.

#### Price:

One Shilling net,

Bookstalls.

# MISCELLANEOUS ADVERTISEMENTS.

## PRICES.

**ADVERTISEMENTS** in these columns—First 12 words or less 1/6, and 3d. for every two words after. Each paragraph is charged separately. Name and address must be counted. Series discounts and special terms to regular trade advertisers will be quoted on application.

Postal Orders sent in payment for advertisements should be made payable to **ILIFFE & SONS Ltd., and crossed** & Co.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor St., E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

## NUMBERED ADDRESSES.

For the convenience of advertisers letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charge. Only the number will appear in the advertisement. All replies should be addressed, "No. 000, c/o 'The Motor Cycle,' 20, Tudor Street, E.C."

## DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged, when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

## SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

## DEFENCE OF THE REALM ACT

Under the provisions of the above Act, advertisers requiring workmen, and whose business consists wholly or mainly of engineering or the productions of munitions of war, or substances required for the production thereof, and whose works are situated within 30 miles of London, must include in every such advertisement the words, "No person resident more than 10 miles away, or already engaged on Government work, will be engaged."

Advertisers whose works are situated more than 30 miles from London can only have their announcements inserted with the approval of the Board of Trade, who will allocate to each advertisement a box number, and collect and distribute to the advertiser all replies received. The necessary forms of application can be obtained from any Labour Exchange or from the offices of this paper, and each advertisement must contain a clear reference to the effect that no person already engaged on Government work need apply.

## SPECIAL DESIRABLE SECOND-HAND BARGAINS IN STOCK AT OUR GLASGOW HOUSE.

Call and see these, or write for our full List, in which you will surely find just what suits you.  
CALTHORPE, 4 h.p., 1916, with Sidecar. £60 0  
INDIAN, 7 h.p., 1912, 2-speed and Sidecar. £36 0  
HOBART, 2½ h.p., 1915, 2-str., 2-sp., shop-soiled only, worth special notice. £29 10  
DOUGLAS, 2½ h.p., 1914, T.T., 2-speed. £34 0  
NORTON, 3½ h.p., T.T., extra value. £23 0  
CLYNO 6 h.p., 1915 Comb., detach. wheels £68 0  
ENFIELD, 6 h.p., 1915, with Sidecar and all accessories, grand value. £80 0  
HUMBERETTE, 8 h.p., hood, screen, and all accessories. £38 0  
DOUGLAS, 2½ h.p., 1915, Model U, fine condition. £39 0

## MONEY SAVING SECOND-HAND BARGAINS IN STOCK AT OUR EDINBURGH HOUSE.

Every one worth a lot more, and all offering big attractions to keen buyers.  
TRIUMPH, 3½ h.p., fixed eng., special value £20 0  
CALTHORPE, 2½ h.p., 1916, 2-str., 2-sp. £26 10  
CALTHORPE-J.A.P., 1915, 2-speed. £27 0  
SPARKBROOK, 2½ h.p., 1915, 2-str., 2-sp. £27 10  
RUDGE, 2½ h.p., 1912, 2-speed. £27 10  
INDIAN, 7 h.p., 1913, S & C, hood, screen £40 0  
INDIAN, 2½ h.p., 1916, 2-str., 2-sp., kick. £44 0  
LINCOLN-ELK, 3½ h.p., worth special notice £8 0  
RUDGE, 3½ h.p., 1913, Multi gears. £35 0  
INDIAN, 5 h.p., 1916, 3-speed. £53 0  
INDIAN, 7 h.p., spring-frame and Sidecar £45 0  
DOUGLAS, 2½ h.p., 1915, Mod. V, 3-sp., kick £48 10  
B.S.A., 4½ h.p., 1914, 3-sp., kick, & S. car. £48 10  
Many others slightly used, at really surprising prices. Full Lists free.

## MOTOR FUEL.

Unequalled values in the most successful brands. Bealot, 2/6 gal. Best Petrol Mixing Fuel, 2/- gal. Doubles your petrol allowance. Splendid for efficiency.

113-115, Lothian Rd., Edinburgh.  
272-274, Gt. Western Rd., Glasgow.

## MOTOR CYCLES FOR SALE.

## Rex-Jap.

REX-J.A.P. 6-8h.p. Combination, cane sidecar, 2 speeds, free engine, in perfect condition; any trial; 1913; £40, all accessories.—10, Clifton Rd., Luton. [X4274]

## Roc.

ROC 3½h.p. Motor Cycle, 2-speed gear, very fast and powerful; any trial; must sell; sacrifice £34.—Eyers, Orchard Lane, Southampton. [X4491]

## Rover.

ROVER, new 1917 latest model combination, in stock.—Moss, Wem. [X0944]

ROVER, 1918, 4h.p., T.T., Phillips pulley, almost new, fully equipped; £45.—Below. [X4464]

ROVER, 1914, 4h.p., 3 speeds, fully equipped, as new; £36; with coachbuilt sidecar, £45.—6, Warren St., London. [X4464]

ROVER, 3½h.p., clutch model, sound, but not smart; £22, or your reasonable offer.—Laytons' Garage, Biester, Oxon. [X0509]

ROVER Motor Cycle and Sidecar, 3-speed gear, free engine; £40.—George Newman and Co., 307, Euston Rd., London. 'Phone: Museum 1568 and 1569. [X4270]

1914 Rover Coachbuilt Combination, clutch, 3-speed, wind screen, luggage grid, 3 lamps, perfect condition; £36, or nearest offer.—Barton, 134, Earl's Court Rd., W. [X4435]

P. J. EVANS, sole Birmingham Rover agent.—Immediate delivery T.T., semi T.T. models, with or without Phillips, also latest countershaft models.—87-91, John Bright St., Birmingham. [X0922]

1917 Rover Combination, 3-speed countershaft gear, all the latest improvements, as illustrated in "The Motor Cycle" of Sept. 25th; price complete £89/9.—W. Brandish, Triumph Garage, Coventry. [X9654]

## Royal Ruby.

RIDER TROWARD, 78, High St., Hampstead.—1915 Royal Ruby, 2-speed, 2-stroke; 25 gns. [X4403]

1915 2½h.p. Royal Ruby, splendid condition; £20.—Wilkin and Co., Hunters Bar, Sheffield. [X0962]

ROYAL Ruby, 2-stroke, 2-speed model, quite new, in stock; £36/10.—Davenport Vernon and Co., High Wycombe. [X0859]

ROYAL Ruby, 2-stroke, 2½h.p., 1915 (late), condition as new; illness; £20.—90, Pretoria Rd., Streatham, S.W., after 8, or write J.K. [X4279]

## Rudge.

31 h.p. Rudge Multi; £50; cash or easy terms.—R. E. Jones (Garages), Ltd., Swansea. [X0864]

1912 3½h.p. Rudge, free engine, good condition; £25.—R. E. Jones (Garages), Ltd., Swansea. [X0785]

RUDGE, 3½h.p., 2-speed, free engine, and sidecar; £29/10.—Motor Exchange, Horton St., Halifax. [X4186]

RUDGE Multi, 3½h.p., T.T., Isle of Man model, 1915, with or without sidecar.—38, Radnor Drive, Liscard, Cheshire. [X4303]

RUDGE, 1914, 3½h.p., clutch, splendid condition; must sell; £26.—Gifford, Hut 83, R.N. Air Station, Sleaford, Lincs. [X4245]

RIDER TROWARD, 78, High St., Hampstead.—1914 Rudge Multi 5-6h.p. coachbuilt combination, fully equipped; 37 gns. [X4401]

RUDGE Multi, 1914, 5-6h.p., excellent order; £30; will consider a lighter machine in exchange.—46, Hillcrest Rd., Acton. [X4445]

RUDGE Multi, 1913, completely overhauled, nearly new coachbuilt sidecar, sound lot; £35.—D.H., 7, East Rd., Maidenhead. [X4499]

RUDGE Multi, 1913½, 3½h.p., hand clutch, perfect condition throughout; 24 gns.—245, Hammersmith Rd., London, W. [X4504]

1914 Rudge Combination, 3½h.p., 3-speed, free engine, lamps, horn, accessories, new condition; owner joined up; £39/10.—8, Warrington Rd., Ashton-in-Makerfield, Lancs. [X4292]

1913 Rudge, new tyres, lamps, horn, Senspray, excellent running order; officer proceeding overseas; nearest £22; Bournemouth district.—Box 424, c/o The Motor Cycle. [X0862]

RUDGE Multi, late 1913, 3½h.p., P. and H. lamp set, speedometer, excellent condition throughout; bargain; £27/10.—Cass's Motor Mart, only address, 5, Warren St., Euston Rd., W. Museum 623. [X4521]

RUDGE Multi, 1914, 3½h.p., in fine order, £34/10; also a 1912 2-speed, with cane sidecar, £25; deferred payments if desired.—Lamb's, 151, High St., Walthamstow, and 50, High Rd., Wood Green. [X4327]

## Scott.

COLMORE Depots, Birmingham and Manchester, for Scott motor cycles. [X0806]

SCOTT, 1916, with Millford wicker sidecar, perfect condition; £60.—Potts, 33, Bigwood Av., Hove. [X4354]

1913 3½h.p. Scott, with lamps, etc., perfect running order; £20, or exchange for lightweight.—119, Alliance Av., Hull. [X0827]

SCOTT, 1914, 3½h.p., 2-speed, new head lamps, Covey speedometer, splendid order, with new Canelet sidecar, all new tyres and tubes; £45, lowest.—Ashworth, Dursley, Glos. [X0453]

## Permits for New Motor Vehicles.

**S**IMULTANEOUSLY with the issue of the Board of Trade returns for October, showing that exports had increased roughly 100%, came the announcement by the Minister of Munitions that no further work upon motor cycles or cars could be performed after November 15th except by permit. We referred to the Order in our last issue, and since then we have had an opportunity of testing the feeling of the trade in the matter. As we have already pointed out, the majority of motor manufacturing firms are at present engaged almost wholly upon munitions of war, and others who were producing motor cycles made a point of exporting as big a proportion as possible. To those firms who were doing their utmost to follow the exhortations of the Board of Trade to specialise on the Overseas market, the ruling came as a great surprise, and for a few days considerable disorganisation of works occurred. Motor vehicles are not made in a week, and, obviously, plans for an output, however small, must be laid well in advance. At first, manufacturers regarded the edict as drastic and serious, and very quickly the representative firms gathered together in order to decide upon a plan of action. It was felt that if the Government intended to control the output of motor vehicles by freely issuing permits as in the case of steel and other valuable war material, then no one could complain, as war requirements must receive priority. Some manufacturers, however, regarded the order as a death blow to trade in new vehicles as well as repairs. That such views were ill-founded is confirmed by the secretary of the Motor Cycle Manufacturers' Union to whom we broached the subject subsequent to an interview he had with the Government department concerned. Mr. Bednell points out that the Government are not obstructionists; they still regard Overseas trade as of the greatest importance, that their action was merely to put the production of motors into line

with that of steel, for instance, and that, where it can be proved that the output of munitions will not be hindered or war requirements affected by the making of motor vehicles, then permits will be freely issued. This announcement should relieve those members of the trade who had interpreted the Order in the blackest manner possible. Those manufacturers who have been able to continue in a quiet way have had the greatest difficulty in obtaining adequate supplies of material, and undoubtedly the consideration of supplies for the Army and Navy has been one of the governing factors in the decision. Again, it is possible that the Minister of Munitions has been misled as to the number of workers engaged in the output of motor vehicles, and considers that such men will be more usefully employed in their country's cause on strictly Government work. This, of course, is reasonable enough, but surely one could well have expected a more extended intimation. Were permits not to be issued freely, the rulings of different Government departments would be entirely at variance, for as the matter now stands there are thousands of pounds worth of incomplete cars and motor cycles lying about the different works throughout the country, which with the attention of a little more labour would mean a large number of valuable vehicles which could be exported and so bring to this country gold to assist our exchange. We have been told throughout that "silver bullets" are as necessary in this war as man power and munitions, and as we have shown, there is little reason to suppose that there is to be a sudden reversal of such an obvious view of the situation.

Finally, the Order is an interesting specimen of ambiguity so typical of Government departments. A number of different interpretations of the Order were made during the first two or three days, and we encountered manufacturers of sidecars and bodies, who with but a week in hand were at a loss to know whether they were covered by this ruling or not.

### Big Back Tyre v. Spring Frame.

My colleague's comparisons between the four-cylinder Henderson (rigid frame) and the flat twin A.B.C. (spring frame) were naturally of intense interest to me, as I know both machines well, though all my Henderson experience has been garnered with the models which have two-speed epicyclic hubs. His point that a flabbily inflated 3in. back tyre is a tolerable substitute for a spring frame is certainly true up to a point. On decent roads a soft back tyre of great size, in conjunction with a good spring fork, ensures reasonable comfort. But this combination cannot be termed ideal. I do most of my riding on very bad roads, and I do not find that a loose 3in. tyre is comfortable enough for me, or even that it approaches the comfort of a good sprung frame with a hard back tyre. There are two more sub-aspects of the same point which demand attention. Three-inch tyres, loosely inflated, are very prone to side-slip where provocable to skidding exist; they are not nice riding, for example, on winter roads in Devon or Durham, though well enough on our wide straight trunk roads, with hard surfaces. Further, they have not been applied to  $3\frac{1}{2}$  h.p. machines, nor is it likely that they will be.

### A Sparking Plug Cooler.

The accompanying sketch represents two small fittings which will soon be placed on the market by Mr. F. M. Fletcher, of Bamford, near Rochdale. They consist of two attachments intended to keep a sparking plug cool in a two-stroke or a super-efficient engine. One of them takes the place of the ordinary copper-asbestos washer, being threaded over the plug before it is screwed into the engine; its central ring closely resembles the ordinary washer, but carries three dished radiating fins of thin copper (about 3in. in diameter), which radiate heat away from the butt of the plug and the surrounding cylinder metal. The auxiliary device is a light inverted aluminium thimble, which screws on the outer end of the central electrode, below the terminal nut; it serves the double purpose of helping to cool the central electrode, and also of keeping the insulator dry in rainy weather, like the so-called "plug umbrellas" already on sale for the latter purpose. I have tested both articles, and find that the radiating fin washer makes all the difference to a plug; without this washer my two-stroke usually stops (from "silent discharge"?) up a certain hill; with the washer it invariably climbs it. I did not find the umbrella cooler equally efficient in tests with the same plug and engine. It must make some difference

Cooling plug device.

to the cooling of the sparking plug, but it did not prevent overheating of the plug in this particular test. It would be interesting to know whether, in the case of incandescent electrodes, the centre or outer electrode is more commonly the sinner, or whether both are *participes criminis*. The above tests were made with a thick central electrode, and rather a thin side electrode. If I can fake up a plug with a thin centre electrode and a thick side point (resembling that on the Lodge racer), I might find that the umbrella cooler stopped such a plug from overheating, whilst the triple copper fins had no effect.

### Overheated Plugs.

Mr. R. J. Cosh complains that he cannot find plugs which will stand up on his  $3\frac{1}{2}$ -h.p. flat twin Brough, and enquires as to my luck. I can overheat practically any standard plug with the A.B.C. if I want to, *i.e.*, by driving it hard on full throttle on second gear ( $9\frac{1}{2}$  to 1), a test which is rendered feasible by the excellent balance of the engine; indeed, I usually apply this test to sample plugs, and that not infrequently on the level. In normal road work I experience very little plug trouble with this engine. It does not overheat a good standard plug at speed on the third and fourth gears, and, when second gear is requisitioned, the road very seldom admits of anything like full throttle. I have had far more trouble with overheated plugs on smaller engines.

If I were entering a small engine for a six days trial, including such climbs as Applecross and Torna-press, I should pay very special attention indeed to the choice of a plug; I have no manner of doubt that hundreds of failures on test hills in the big reliability trials of the past have been simply and solely due to unsuitable sparking plugs. On the other hand, a big engine of the "woolly" type, driven at considerably under its full efficiency, seldom heats up a plug. In this connection a very interesting fact was announced last week by Mr. Ludlow Clayden, late a member of Messrs. Iliffe's staff, and now in New York. The standard American plug is larger than ours, but the American racing experts have regularly used the European metric plug on their racing engines since the autumn of 1913. The greater the diameter of the plug, the greater the separation between the central electrode, and the cooling jacket of the engine (in their case, a water chamber; in ours, fins). So plug manufacturers appear to be in something of a dilemma. On the one hand, thicker insulation seems desirable, if the huge electrical pressures generated at modern engines' rates of r.p.m. are to be resisted. On the other hand, a plug no thicker than a pencil would apparently solve the cooling problem. Progress is being made very rapidly, and I have no fears that our plugs will not somehow keep pace with the developments in engine design.

# THE NEW IMPERIAL CO.'S LATEST MODELS.

General Design Retained, with many small Detail Improvements.

New Imperial  $3\frac{1}{2}$  h.p. model with three-speed countershaft gear, clutch, and kick-starter, and the  $2\frac{1}{2}$  h.p. two-speed lightweight fitted with clutch and kick-starter.

THE New Imperial Cycles, Ltd., of Princip Street, Birmingham, are principally known for their excellent  $2\frac{1}{2}$  h.p. four-stroke lightweight, a sturdy little machine, capable of any amount of hard work, and having a very fair turn of speed. Their other lines are the  $2\frac{1}{2}$  h.p. lady's model, the  $3\frac{1}{2}$  h.p. single, and the 6 h.p. twin machines. These last two models are essentially reliable productions; but, unfortunately, the company, by reason of labour shortage and prevailing conditions, have only been able to turn out a very small number. The conditions were more favourable to the lightweight, and the  $2\frac{1}{2}$  h.p. single has been produced regularly.

Neat priming arrangement for starting on the  $2\frac{1}{2}$  h.p. machine.

## Few Alterations.

There are certain alterations to small points, but substantially the 1916 model is being retained. The J.A.P. engine  $70 \times 76$  mm., giving 292 c.c., is too well-known to need description. The magneto is gear driven, but a new engine is under test, which has chain drive to the magneto placed well up behind the cylinder, and no doubt this will be adopted as standard in the future. The frame has been considerably strengthened by a

Method of constructing the frame with large head and seat lugs and supports for the tank.

special head lug and a combined seat tube and under tube lug, whilst special lugs on the under tube form a very strong support for the tank. Clutch, gears, and transmission remain as before, except for certain alterations to the kick-starter, also to guard against the possibility of

the lock nut on the clutch end of the countershaft working loose a small twelve-sided cap is fitted, with a peg at one side fitting into a hole in the clutch plate, so preventing any movement of the nut.

Back brake alteration; formerly it operated below the stay with a cranked rod.

The back mudguard has been improved by increasing the width, and now affords ample protection. The back brake has been redesigned, and is now placed above the lower stays. A neat idea is the enclosing of the gear control quadrant in an aluminium cover. A small priming tap on the engine head and a pipe leading from the petrol tank are provided to facilitate starting, although it seems hardly

Improved back mudguard with side extension, on the  $2\frac{1}{2}$  h.p. lightweight.

necessary, as the engine in good condition fires very readily. A new pattern semi-T.T. handle-bar, all black finish to the wheels, and some alterations to the usual colours and lining of the tank, form the other departures from present practice.

## Serviceable Lightweights.

These mounts are essentially lightweights, but with many of the refinements

of the heavier mounts they form reliable solo machines. One machine in constant use in the works has made numerous successful runs between Birmingham and the South Coast, and has a very large mileage to its credit. The big brothers of the lightweight, the  $3\frac{1}{2}$  h.p.  $85.5 \times 85$  mm., and the 6 h.p. twin  $76 \times 85$  mm., are very creditable productions on good standard lines. No particular alterations are to be made, but, as previously mentioned, these two models cannot be supplied at the present time. Prices remain practically the same as in 1916.

Aluminium cover to the gear lever quadrant.

## THE JOHANNESBURG-DURBAN RECORD.

NOW that the African campaign has been nearly brought to an end increasing interest in South Africa is being devoted to motor cycling. One of the most recent events is the breaking of the record from Johannesburg to Durban. The fastest train between the two towns takes 23h. 22m., and on September 7th Mr. D. Owen, on an Indian and sidecar fitted with Bates tyres, completed the journey in 16h. 43m. On September 13th, however, Mr. McKeagh, on an Enfield, improved on this time by fifty-two minutes. Not to be beaten, Mr. Owen made another attempt, and completed the journey in 14h. 50m., no less than  $8\frac{1}{2}$  hours quicker than the time taken to do the journey by rail, thus winning back the record with an hour to spare. Taking into consideration the rough nature of the road, the number of obstacles and gates, this is a really remarkable performance, and one, we are informed, which is not likely to be beaten for some considerable time. Mr. Owen reports that his tyres at the end of the journey were in first-class order.

# A Run to the Welsh Coast.

THE writer recently had the opportunity of comparing the running of his standard Clyno sidecar outfit with that of a model supplied to the War Office. It will be interesting at the commencement to compare the chief points of difference in the design. These are the substitution of Brampton forks, reinforced lugs to the front portion of the frame, an improved clutch oiling device forming an extension of the gear box, six-point attachment for the sidecar, lower gear ratios, and a spring seat-pillar. Prior to the machine being handed over it had covered nearly 2,000 miles in the hands of different pilots. A start was made from Coventry at two o'clock in the afternoon, and the destination for the night was to be Aberystwyth. Desiring to be independent of garages which seem to carry varying stocks of petrol, I took the precaution of carrying a spare tin.

The Clyno ascending a rough track leading from a Welsh trout stream.

## Easy Steering.

The first point noticeable was the extreme ease and comfort of the steering. It was most marked, and the machine is certainly one of the best in this respect the writer has ever driven. The next point was the tendency of the driver at times to put his hand to the gear lever in the attempt to change into a higher gear, when he was already on top. This tendency (after riding a standard model) is caused by the much lower gear ratios used on W.D. models than on the standard machines necessitated by the conditions of the road surface overseas and the heavy load the machines carry. The top gear of the W.D. model is  $5\frac{3}{4}$  to 1, and such a low ratio rendered it unnecessary to change down on hills, and incidentally the speed on the level was quite good. With low gearing the transmission noises are naturally more noticeable, and certain sounds emanating from below which could not be accounted for caused some concern at first, and it was decided to investigate matters next morning.

## A Thorough Overhaul.

Taking matters easily, I reached Rhayader, and elected to stay the night here with the intention of viewing the Birmingham reservoir before breakfast. Next morning rain came down in torrents, so my passenger and I rolled up our sleeves to give the machine a thorough overhaul. It is a nice thing to spend the second day of a holiday tuning up! Wheels were taken out, bearings adjusted and oiled, and every part of the bicycle and sidecar was thoroughly lubricated. Slackness in the driving and magneto chains was taken up, and as the weather had improved we set out again a good deal more confident than formerly. The surrounding country was very picturesque, and we were able to enjoy its beauties. The Clyno, too, had benefited immensely by the overhaul, the transmission noises having entirely disappeared, and on the rough stretches of road I observed that the time spent on lubrication of the spring forks.

Taking the steep rise from the coast near Borth. Cardigan Bay is seen in the distance.

**A Run to the Welsh Coast.—**

wheels, and leaves of the sidecar springs had not been wasted. Too little attention is paid by many drivers to these minor points, which spell increased comfort and longevity of the wearing parts of the machine.

**A Water Test.**

Nearing the coast we made a slight *détour* to do as all others do, viz., visit the much-famed "Devil's Bridge," leaving the main road at Dyffryn Castell. A Scotch mist in Wales seems certainly out of place, but here we encountered one so thick that before I realised it we were in the middle of a stream. In ordinary weather the stream is shallow, but, owing to the incessant rain, it was about 15in. to 16in. deep, and between twenty and thirty yards across. The machine ploughed its way through without a misfire, thanks to the protected position of the magneto and enclosed chains. "The Devil's Bridge" was reached without further incident, but from my point of view it was a wasted trip, for the thick fog totally obscured the surrounding hills. Aberystwyth was a contrast and looked tempting enough, for it was quite fine. Some steep hills in the neighbourhood perhaps naturally tempted us to try our luck, for the Clyno is a noted hill-climber. I found one about half a mile long with a gradient of about 1 in 4 leading up from the seashore near Borth. Even at the first attempt I had no difficulty in getting up. At the summit there is a magnificent seascape. Other hills, too, enabled me to test thoroughly the latest W.D. Clyno, and nothing I encountered proved too much for it.

On the journey home the conditions were vastly improved, the sun shining gloriously, and I settled down to a steady pace of 28 to 30 m.p.h. The engine ran perfectly the whole of the tour, and though not as fast and not quite as silent as my own standard touring machine—doubtless accounted for by the difference in the gearing—there is no doubt that it is a most efficient machine for the purpose for which it was

**A TYPICAL WELSH SCENE.**

Fording the stream mentioned in the article. (Note that the water had subsided.)

designed, viz., "war work." With the exception of the back tyre going soft through the penetration of a tack no trouble was experienced. The operation of changing the wheel took but 2  $\frac{1}{4}$  m., which says much for detachable wheels, and is a refinement greatly appreciated by all. M.

## WITH A SIDE CAR ON THE SOMME.

What Service Machines have to Withstand.

By BARAG.

A motor machine gun battery taking cover in a sunken road on the Western front. Three motor bicycles belonging to the battery scouts are to be seen in the foreground: a Douglas, Sunbeam, and B.S.A. The sidecars are, of course, Clynos.

**B**E it known by these presents to all whom it may concern that a pot-hole is one thing and a shell hole another, and that a sidecar built to withstand the former is not *ipso facto* competent to deal with the latter. By the same token the outfit which will stand up to French and Belgian roads in their present condition is not yet constructed. These remarks, of course, only concern the roads within, say, fifteen miles of the actual firing line. The glowing eulogies written on the subject of motor cycles and sidecar outfits at the Front hold good in the main only for districts further back, more remote from the actual firing line, where the roads, if not good, are at any rate passable. One may without malice opine that the eulogies in question are penned with the rather curious object of bringing home to the general public the glad (though erroneous) news that some individual, hitherto unknown to them, spends his entire existence heroically conveying details of motor transport along unutterable surfaces to the accompaniment of inconceivable shell fire.

### The Story Begins.

The following true and particular account of a thirty-mile run may be of little interest as showing some of the many ills the bicycle is heir to. Let us call it "How we brought the sardines from Blank to Blank," and, before proceeding further, allow me to introduce the principal persons of the drama in order of importance.

First, the machine, whose actual designation it will perhaps be as well to keep dark. At any rate it is a 5-6 h.p. twin, and the engine is, in my humble opinion, the finest in any entirely British cycle. The

sidecar is a hideous, slab-sided, official looking affair, suspended by a C spring aft and a three-leaf transverse spring forward, an admirable system for the Brighton road in point of riding qualities, but of little or no use for the conditions prevailing out here. Secondly, the driver, a young and humorous bombardier, a civil engineer, and, in happier times, a budding road surveyor. At present he is almost entirely occupied in keeping together the souls and bodies of our two sidecar outfits and one solo machine. They are wife, family, and daily bread to him, and he groans from the depths of his sensitive soul at every hole and excrescence they hit.

Thirdly, my unworthy self, a subaltern in a siege battery, and the secretary of its officers' mess, to which fact, coupled with the existence of an urgent official and secret letter which had to be delivered at the ordnance workshops, I owe it that I am in a position to write these notes. It came to pass this fateful day that I took sweet counsel with the mess cook, and discovered that we were in lack of tinned goods, coffee, fruit, vegetables, fresh eggs, bread, and butter (our greatest luxuries, and by no means easily procurable), and that, worst of all, we had no drinks. Accordingly I warned the bombardier that I should require our three-legged Rolls to be champing at the bit at 10 a.m. precisely. To which he with dolorous countenance made answer, "Well, sir, I doubt if it'll do it. The centre leaf of the C spring has cracked, and keeps slipping out, and the transverse spring broke while I was bringing the captain back from — yesterday, and I've patched them both up with D 5." (D 5 is the strongest type of telephone wire obtainable by anyone of less importance than a

**With a Sidecar on the Somme.—**

divisional signalling officer, and it is used for all sorts of purposes besides the communicative one for which it is issued.)

My response was that we couldn't starve, and that it had darned well got to try. Moreover, the aforementioned letter had to be delivered to the I.O.M. (Inspection of Ordnance Machinery) that day.

**The Sidecar Starts.**

On these lines we bumped forth on our fifteen mile journey. For a few miles all went well. Considering the rather "rag-time" repairs which had been effected, the sidecar rode remarkably well, and I was just beginning to relax my funk-stiffened spine and enjoy myself when a series of sickening thuds and inexplicable clanks became audible from the front wheel, and the machine swerved to the left and made a determined attempt to "savage" a passing lorry. "Oh, lor'!" ejaculated the bombardier, and dis-

as much of the inside of the cylinders as an electric torch would show us indicated that it had been getting a good mixture, and disclosed nothing which might cause the trouble, so we were forced to conclude that the timing gear had slipped. The bombardier, admirable soul, announced that he could fix it. I "knew that I knew nothing," so turned my attention to a clump of trees near the road, where I had reason to believe some friends of mine had established their local habitation. They were there, took me in, gave me lunch, and sent out food to the bombardier, who, an hour later, reported O.K.

**The Story Ends.**

We arrived at our destination without further mishap, delivered the precious document, made our purchases, and started on the run home. With its nose towards its stable the old 'bus behaved better, and we only had to stop five times for a few minutes to replace various bits of D5 which it frivolously cast adrift. (We

A motor machine gun battery leaving in answer to a signal. It will be noticed that all the men are equipped with steel helmets.

mounted. So did I. Our machine has a stoutly-sprung front fork with the bases of the springs held together by a bolt. This bolt had snapped at the near end, with the result that the springing was, to put it mildly, precarious.

The ever-resourceful bombardier produced some more D5 and a spanner, another Heath Robinson repair was successfully carried out, and we proceeded on our way.

**The Sidecar Stops.**

Five miles later it conked out altogether, and we again dismounted. This time we were, in the terse phrase of the British artilleryman, "in for it." Repeated applications of the kick-starter having failed to produce any signs of life, we ground our teeth, took off our coats, and got down to it. We removed the plugs and scraped off the soot. Again quoting the gunner, "No bon." We discovered that petrol was flowing freely, and after flooding the carburettor made another attempt. "No bon" again. We fitted new plugs, first ascertaining that they gave a good fat spark. But "no bon" once more. Examination of the plugs and

had abstracted quite a quantity when the Signalling Corporal's back was turned. He has since discovered the theft, and he and I are not quite on our old friendly footing yet.) "The shades of night were falling fast" when we got back, tired and hungry, and, with many imprecations, pushed the outfit into the little corrugated iron hut which serves as a garage.

**The Moral.**

Perhaps the foregoing remarks may convey what it was my purpose to convey, namely, that, magnificent though the British machine is, sufficient attention has not yet been paid to the fact that abnormal conditions require abnormal strength and abnormal efficiency, and that much yet remains to be done before an outfit is produced that will stand up to real war conditions. As I have tried to point out, the main weakness lies in the suspension. We do not ask for luxury on active service, and we are willing to sacrifice much of the comfort with which our machines provide us when they are in action in exchange for the strength and reliability which will take us where we need, when we need, and over the only roads we have available.

## The Economy of the Motor Cycle Exemplified.

Experiences of a Reader, engaged at the Ministry of Munitions, who uses a Lightweight in his Work.

**A** PART from Service riders, few motor cyclists put their machines through their paces like the owner of the little two-stroke Allon illustrated on this page. It was delivered on June 20th, 1916, and the mileage up to September 25th was 5,800. This works out at an average of fifty-nine miles a day for fourteen continuous weeks, and is a good test for a small machine.

### Choice of a Machine.

The owner is in the Ministry of Munitions, and his work entails constant travelling through the big industrial centres of England south of Yorkshire. All through last winter he travelled solely by train, but, in the spring, with a view to saving time, he turned his thoughts to a motor bicycle. Friends were rather sceptical when he chose a lightweight, thinking that a faster mount would be more suitable for the work, but the owner wanted an economical mount, also one that would be handy in traffic. The results have shown him to have been very wise in his choice, the Allon having proved a great success.

The machine is a standard two-speed model, and, as will be seen from the illustration, an auxiliary tank has been fitted over the top tube. The machine runs fairly satisfactorily on paraffin, but the owner, by reason of his work, has no difficulty in obtaining all the petrol required, and so he sticks to the latter. The capacity of the main tank is  $1\frac{3}{8}$  gallons, and the auxiliary tank  $\frac{5}{8}$  gallons. A useful fitment was that of a tin scoop under the carburettor to prevent petrol dripping on to the chain case, when it worked into joints and destroyed lubrication. Before the scoop was fitted two broken magneto chains were traced to this cause; they occurred at 550 and 1,200 miles respectively. This trouble has now been

remedied by the fitting of a pressed steel chain cover.

As regards tyres, the first puncture (on the back wheel) did not come until 3,500 miles had been covered, and then there were four between that and the 4,200 figure. At the latter, the tyres were changed from one wheel to the other, and are still in excellent condition, the rubber centre studs on the original back tyre being still visible.

### An Easily Dismantled Engine.

The engine has been taken down three times. This is a simple matter with the Alldays engine, as by undoing eight bolts the bottom half of the crank case, with the piston, connecting rod, crankshaft, bearing, etc., may be removed without disturbing any connections. On the first two occasions the top ring was stuck. At 5,000 miles a heavier driving chain and special rings were fitted, and are going well. The big end was also taken up.

During the period under review sixty-one gallons of petrol and six gallons of oil have been purchased. The petrol consumption equals ninety-five miles per gallon—remarkably good figures, especially when one considers the amount of town work the machine has to accomplish.

The owner has used his machine for about ninety per cent. of his work, a very small proportion of train travelling being done, though with the approach of bad weather the train may be used to a greater extent.

For cross-country work it is invaluable, and enables many more firms to be visited in a day than would be possible by train. At the same time it is often quicker to use the machine for runs from one town to another connected by good train services, because works are generally in the suburbs of the large towns, and with the two-wheeler one goes direct and so saves

The two-stroke Allon referred to in the accompanying article.

**The Economy of the Motor Cycle Exemplified.—**

tram or 'bus journeys from main stations to outer districts.

**A Typical Day's Run.**

Taking a rather heavy day's run, a start was made from Coventry about 8 a.m., calls being made at Leicester and Stamford, and Chatteris, where another call was made, was reached by lunch time. Business being completed by three o'clock, the journey was continued to Ipswich in time to pay another visit before closing time. The total distance is about 175 miles. Such a journey by train would be very tedious, owing to it having to be made on branch lines with

Auxiliary tank connections (top) and shield fixed to carburettor to prevent petrol dripping on to magneto chain.

poor services. Even with good connections it would mean making seven changes and then not doing it all in the day. Such an itinerary is, of course, favourable to the motor cycle, but it is not an exceptional case.

In conclusion it may be added that the owner is all the better in health since he took to travelling by road. The work at any time is trying, as there are no fixed hours, and after a hard day's work there is a good deal of writing to be done, but there is no doubt that the man who has spent much of his time in the fresh air on a motor cycle, and consequently feels fit and well, is better able to undertake this than the man who travels by train.

R.C.F.

## Methods of Guarding Against Side-slip.

**M**ANY riders imagine that, so long as they equip their machines with good tyres, they have done everything that is possible to divert the inconvenience of side-slip, but there are several points, the sum total of which is quite as important as good tyres, which concern one's safety on the road during the skiddy season.

Nervousness is, of course, generally the cause of skidding. The nervous rider sets his body rigid on approaching a greasy patch, with the result that his front wheel is forced out of its natural course; whereas, if he were to sit his machine quite naturally and plug straight through it, nothing dreadful would occur. One thing is certain—that neither good tyres nor a good machine will save the clumsy rider, and if the likelihood of side-slip is a real source of anxiety to him, he would be well advised to purchase a light sidecar as a counter stabiliser. The throttle should be opened gradually, so that acceleration may not be too violent and cause the wheel to spin.

**Low Compression Desirable.**

The old dodge of lowering the compression of one's engine for the winter months is an excellent safeguard against skidding. This can be done by inserting a stiff cardboard packing, smeared with seccotine, between the cylinder and the crank case. For a  $3\frac{1}{2}$  h.p. single the washer may be  $\frac{1}{16}$  in. thick, for a small twin  $\frac{1}{32}$  in. or thereabouts, for each cylinder. Take care to readjust the tappets, and then test them with the engine hot.

The reduced compression gives the engine an increased range on top gear; it does not detract noticeably from its "revving" capabilities, but it softens down the explosions at low speeds, so that there is less snatch of the tyre on the road at the moment of firing. For this reason a small twin or two-stroke is less liable to side-slip than a single-cylinder.

Quite as important as good tyres is a good carburettor. Most present-day carburettors are good if pro-

perly adjusted, but from the winter rider's point of view some are undoubtedly better than others.

However perfect a carburettor may be, one cannot obtain perfect response unless the control wires are working properly, and the smooth working of these controls is a vastly important point as regards side-slip. Recently a beginner handed his machine to the writer for trial, explaining that it did not run so well as it used. It was found that the Bowden wires were rusted, so that the controls moved stiffly and in jerks, and this being set right the machine was returned. "I don't know what you've done," said the owner a day or so later, "but the change is simply marvellous."

It is impossible, then, to obtain smooth acceleration and perfect controllability—which count for everything on grease—unless the carburettor controls are working smoothly, and easily responding to a light and natural pressure of the fingers. Their stiffness should be just sufficient to prevent them from automatically moving their position. If it is found that the friction disc must be screwed down tightly in order to prevent the levers creeping back, this is distinct proof that the springs in the barrel of the carburettor are too strong. In very bad places it is better to run on the low gear and so obtain a more even impulse. Never put the brakes on suddenly.

**Adjustment of Shock Absorbers.**

The friction type of shock absorber may be kept screwed up solid for summer solo riding, but if it is left thus during the winter skidding experiences may be anticipated. Do not tamper with the shock absorber unless you are sure that the drive is too solid. Then to reset the adjustment, jack the machine on the stand, cover the slipping device with oil, then slacken off the lock nuts. Jerk the engine over compression by the back wheel; slowly screw up the nuts till no slip is perceptible on the most violent jerk. This should give the proper adjustment, but a subsequent road test is generally necessary.

H.M.B.

## Will the Single-cylinder Survive ?

### An Experienced Amateur's Impressions as a Result of Prolonged Road Test.

The possible doom of the single-cylinder was discussed by "Road Rider" in our issue for September 28th. The question was taken up by "Ixion" in his Occasional Comments and by several readers in our correspondence columns. "Ixion" agreed with "Road Rider" in the main, but their opinion is by no means shared by all our readers, as witness the remarks on this page by an experienced rider.

**I** SHOULD like to endorse the remarks of Mr. A. C. Huskinson in *The Motor Cycle* of October 12th in regard to the comparative merits of the T.T. single and the horizontal twin of 500 c.c.

During the summer of 1914, I had an opportunity of making a lengthy and searching comparison between a 1913 T.T. Rudge-Multi, geared  $2\frac{2}{3}$  to 1 on top and  $5\frac{1}{2}$  to 1 on bottom (being fitted with a small rear belt rim), and a 1914 T.T. A.B.C., fitted with a hub gear in the countershaft position, Claudel-Hobson carburetter, rear springing, chain drive, and both inlet and exhaust valves overhead. It was geared, I think,  $4\frac{1}{2}$ ,  $6\frac{1}{2}$ , and  $9\frac{1}{2}$  to 1. On top the A.B.C. could attain 57-58 m.p.h. in full touring trim on any good road, whilst the Rudge on a gear of about  $3\frac{1}{2}$  to 1 was equally as fast. When stripped, either could attain a speed of about 64 or 65 m.p.h. On any serious main road rise, it soon became necessary to change down on the A.B.C. to maintain a good speed, and it must be admitted that the revs. on low and middle gears were surprising. The Rudge at this time had covered about 3,000 miles more than the A.B.C., but still managed to hold its own on the level as well as being faster uphill. The petrol consumption was 68 to 70 m.p.g. in the case of the A.B.C., and 79 to 82 m.p.g. in the case of the Rudge.

From the point of view of flexibility, the margin was in favour of the Rudge. Its slowest speed was less than that of the A.B.C., whilst on a gear of 5 to 1 it had a greater ratio of flexibility than the A.B.C. on its middle gear of  $6\frac{1}{2}$  to 1.

#### Acceleration Powers.

The acceleration of the A.B.C. was the better up to 30 m.p.h., but from that speed up to its maximum the Rudge was superior, as the A.B.C. was slow in getting going on its top gear. I note "Ixion" makes much of the fact that he can attain 40 m.p.h. on a gear of  $9\frac{1}{2}$  to 1, but surely finality of design is not reached when such a gear is necessary to attain a good uphill speed. I have owned a  $2\frac{3}{4}$  h.p. Douglas which, when in competition tune, could attain 42 m.p.h. on a gear of  $8\frac{1}{2}$  to 1, but I did not think much of this, and was far more keen on getting each additional mile on a higher gear, as I contend that a moderate road speed on such a low gear is not good except as an indication of engine balance. When we compare a good modern T.T. single, such as the Norton, Triumph, or Rudge, which will attain

40 m.p.h. up reasonable main road hills, and in addition do about 8 m.p.h. and 55 m.p.h. also on the same gear, we have some idea of the lack of flexibility of the twin.

A certain section of your readers would the more appreciate "Ixion's" remarks about the A.B.C. had he covered a distance of, say, 6,000 miles or even more on the same machine, as one is naturally experiencing only the best in the early days of a well-tuned factory special, such as I have no doubt he has been fortunate enough to have obtained.

#### Overhead Valve Gear.

After a mileage of just 4,000 in the case of the A.B.C. and slightly less than 7,000 in the case of the Rudge, there was a margin in favour of the latter. The overhead valve gear on the A.B.C. (particularly in the case of the front cylinder, which is very exposed) had worn badly, and there was a racket at anything like the revs. of which it was originally easily capable. I am quite aware that a Rudge overhead inlet rocker can do its share in this line when worn.

It may be that the new model A.B.C. is greatly superior to the one I tried, but, having regard to its high price and the fact that such mounts as the Brookland Road Special Norton are now available at a price considerably less than that of the A.B.C., I am still a T.T. single enthusiast when a solo mount is required.

I have also had experience of the Brough during 1914 and 1915, but not to the same extent as the A.B.C., and here again objected to the exposed overhead valve mechanism.

It is, of course, understood that this controversy centres round the 500 c.c. size only, as my experience is that the 350 c.c. Douglas is in advance of any single of that size as regards speed, general power maintenance, and wearing qualities. There must be some difficulty, which manufacturers find almost insuperable, in designing a 500 c.c. flat twin to give a proportionate power output to the 350 c.c. Douglas. We find that the Douglas firm has on three occasions at least altered completely the design of its 4 h.p. model, whilst the only radical alteration on its smaller mount has been the substitution of mechanical for automatic valves on its 1912 models. The A.B.C. has also undergone many alterations during its three years' existence.

# THE 5-6 h.p. FLAT TWIN MATCHLESS.

70 mm. × 95 mm., 732 c.c., Three Speeds, all wheels sprung.

FEW members of the motor cycle business deserve greater success than H. Collier and Sons, Ltd. Since 1903 the two sons have devoted their lives to the movement, and, by engaging in many competitions and races, have sought to evolve the perfect motor cycle. Having known both Charlie and Harry Collier for the past thirteen years, we have watched the progress they have made in the design of their machine, and have always admired their devotion to their business, which was also their pleasure. In the early days they engaged almost entirely in speed work on the track, and it was while occupied in this that they obtained their wonderful practical knowledge of the motor cycle engine. This knowledge has stood them in good stead, and has been of undoubted value to them in designing their own engine. Although for many years they assembled their machines and bought their engines from outside firms, they were by no means ignorant of engine design, and considerably altered for the better many of the engines built up into their machines. Now, for the first time, they have designed their own motor, and a very successful production it is. Being absolutely up-to-date in their ideas, they have evolved a 5-6 h.p. flat twin embodying the very latest practice in motor cycle engine design. Furthermore, being cognisant of the magnificent future for British motor cycles in the Overseas Dominions, they have placed upon the market a well-tryed and thoroughly efficient spring frame, while not only has the absence of vibration of the flat twin led them to adopt this form of engine, but also the fact that

Threequarter view of the new flat twin Matchless. The whole design is new and original.

the ground clearance is much greater than is possible in the case of the V type engine, the actual clearance being 5½ in. This is a point which will be much appreciated by Overseas customers.

The frame is a total departure from the firm's standard practice. In the first place, the tubular tank of steel, containing two gallons of petrol, forms the top member of the frame, and has a slight

upward slope towards the head. The down tube forms a sort of loop, and acts as a support for the engine. The spring forks have been somewhat improved in design, the lower pair of links being now inside the main members of the forks, which are wide enough to allow the mud-guard to form a perfect sweep from the front of the extension right down to the back.

The system employed in the springing of the rear portion of the frame was clearly indicated in the issue of October 21st, 1915, page 401, and this has only undergone slight improvements in detail. The method adopted is to interpose coil springs between the movable rear forks and the rigid portion supporting the rear carrier. All moving parts, both on the front forks and the rear springing system, are provided with grease cups. These, however, will not be retained. Instead, a grease gun will be supplied, having a screw-on end, and on the dust caps taking the place of the grease cups, being removed, the nozzle of the grease gun may be screwed on to the hollow spindle, and the grease injected. This is much less trouble than the filling of numerous grease cups, one grease gun full being probably sufficient for all the points requiring attention.

## The Power Unit.

The question of accessibility has been carefully studied in the design of the new Matchless engine arrangement, which is so carried out that the cylinders may be removed without taking the engine out of the frame. The radiating fins run longitudinally down the cylinders and taper towards their base. The cylinders are off-set to the amount of one inch. Both valves are horizontal and are arranged at the side in an accessible position, telescopic valve

Details of the power unit of the 5-6 h.p. flat twin Matchless.

### The 5-6 h.p. Flat Twin Matchless.—

spring cams being employed which exclude all grit from the interior working parts of the valve system. Of the two portions of the valve spring cover the larger screws on to a ring surrounding the base of the tappet guide, and when it is found necessary to replace a valve it is unscrewed and slipped back, thus exposing the end of the valve stem and cotter. The valve gear is exceedingly simple and interesting, only three pinions being employed, while one set of cams actuates both inlet and exhaust valves.

The rocking form of clutch pedal is retained. Note the oil lead for lubricating the clutch.

### The Lubrication System.

A plunger pump actuated by one of the valve cams delivers the oil to two passages cast in the crank case, which lead direct to the main bearings; that is to say, the oil enters the bearings at both sides, the crankshaft is hollow and the lubricant is driven under pressure through it and exudes at the big end bearings, all excess returning to the sump. At the base of the sump whence the oil is delivered there is a large gauze which adequately filters it from all impurities. The system has been found to be most successful, and since the oil is delivered under pressure it is bound to reach those parts which need copious lubrication. A window has been let into the crank case just below the filling orifice which indicates the level of the oil in the sump.

### Induction and Exhaust.

The arrangement of the carburetter is somewhat unconventional, the inlet pipe forming a complete bow, passing from one cylinder over the top of the timing gear case to the other, but near the top

of the arc of the bow there is a branch pipe to which the Amac carburetter is attached. Long experience with motor cycle engines has made the brothers Collier realise the fact that it is always beneficial to take the air in warm if possible, no matter whether pure petrol or a petrol substitute be used; consequently a warm air pipe is fitted to the main air intake.

The design of the exhaust pipes is also worthy of note, the pipe from the rear cylinder entering the bottom of the expansion chamber, while the exhaust gases from the front cylinder issue through a short pipe into the top of the expansion chamber, the final exit being through a long pipe on the rear side of the machine.

At first the designers were troubled with a fault which is common to flat twins, namely, a "ring" in the flywheel, and this they have corrected in quite an ingenious manner by interposing between

The crankshaft, showing the manner in which the oil ways are drilled.

the periphery and the flywheel boss a disc of three-ply wood securely bolted up to the face of the flywheel, and this effectually deadens the noise.

### Ignition.

The magneto fitted is the C.A.V., the advance spark lever being actually on the contact breaker and within easy reach of the driver. In actual practice it is found that the position of the spark lever requires practically no alteration. At the bottom of the timing case will be noticed the exhaust valve lifter, the crank for which consists of a small pin eccentrically mounted on a disc, which has a piece cut out of the lower portion, so that on the valve being dropped the indentation rests against one of the studs holding on the timing case cover. The exhaust lifter is of the double cam variety, the two cams actuating the exhaust rockers.

An interesting experiment is the

General arrangement of valve gear and lubricating pump.

fitting of aluminium alloy pistons, which so far have given every satisfaction.

### Transmission.

In the new Matchless the circular type of gear box is retained, but owing to a slight modification of the design of the teeth, which enables the gear wheels to be made lighter, the new gear box is of rather smaller dimensions than previously. It is carried in two plates, extending from the crank case to the bottom bracket lug, and is held in position by two steel straps. To adjust the front chain the two nuts at the ends of these straps are loosened, and by applying a special spanner to two of the lower nuts in the gear box the whole may be rotated, thus enabling any slack to be taken up.

It will be noticed that the Lucas dynamo is driven by a chain off the camshaft, and is carried in a bracket suspended from the tank, the chain being neatly enclosed in an aluminium case.

The clutch consists of two steel plates, hardened and ground, engaging with a central plate of cast iron forming part of the sprocket. An arrangement has been made so that, in the event of the machine being used as a solo mount, the clutch may be controlled by means of a Bowden wire from the handle-bar. The lubrication of the clutch is provided for by a branch pipe from the oiling system.

From engine to gear box the transmission is by silent chain, which is, of course, enclosed.

Considerable ingenuity has been displayed in arranging so that the rear chain cover is free to move with the lower and movable portion of the spring frame.

The mudguarding has been particularly well carried out, the guards being 5½ in. in diameter, while an additional mudshield is fitted to the down tube, and is arranged so as not to impede the cooling. This is continued below the power unit, and acts as an efficient undershield.

### The Sidecar.

The same system of springing as is employed in the rear of the machine has been adapted to the sidecar, inasmuch as both the wheel and also the sidecar body are sprung on coil springs. The form of staying at the rear of the sidecar frame is interesting. This consists of double tubes attached to the uprights forming a portion of the motor bicycle frame. This arrangement enables both the sidecar wheel and the rear wheel of the motor bicycle to move more or less in unison, therefore the fault present in many combinations in which the sidecar wheel is sprung, namely, that of instability and

Rear view of new Matchless sidecar combination, showing the duplex tube joining the sidecar and motor cycle, and causing the two sprung wheels to work in harmony.

**The 5-6 h.p. Flat Twin Matchless.—**

a tendency to lean when turning corners to the left, is entirely absent. The sidecar wheel is also provided with a stand, similar in design to that employed in the front wheel. The sidecar is well sprung and luxuriously upholstered, while at the

Method of fixing the carburettor and the valve spring covers.

back thereof is carried the spare wheel and also an efficient luggage carrier. It will be noticed that both the luggage platforms on the new Matchless are on sprung portions of the machine, which is distinctly an advantage.

**The Machine on the Road.**

We were next taken for a short run in the district round Woolwich, which is decidedly hilly. The first turning to the right past the works brought us on to quite an appreciable gradient, which the engine took comfortably on top speed, mounting up gradually until we reached Woolwich Common. We noticed that the sidecar was exceedingly well sprung,

though Mr. Harry Collier assured us that he was not satisfied as to this point, affirming that the rider was more comfortable on the machine than in the sidecar. The roads were certainly rough in this locality, and personally we could find no fault whatsoever. The engine developed plenty of power, but seemed a trifle noisy—a fault which Mr. Collier readily acknowledged. Hitherto his efforts had been to obtain the maximum power for the engine, and he admitted that it required still further taming down both as regards the noise of the engine and of the exhaust, though with the latter little fault could be found.

On Woolwich Common we took control of the machine and drove for some considerable distance. Having driven a 1916 Matchless not long previously we soon became accustomed to the driving of the new mount. The engine possessed an ample degree of acceleration and was quite free from vibration, the clutch took up the load sweetly, and the gears went into engagement without a sound. The comfort of the spring frame was most noticeable on the rough road across the Common, which eventually brought us into Shooters Hill. A considerable amount of traffic was met, but the engine proved itself flexible, and we felt quite at home in negotiating it. On reaching Shooters Hill Road we found the surface distinctly good, though a little wavy in places, but the machine rode over the waves with an exhilarating and swinging motion which was delightfully comfortable. Having slowed up for the cross-roads at the foot of the hill we were practically brought to a complete standstill through a boy who saw fit to dismount from his bicycle and hold a conversation with a carter in the middle of the road. This necessitated a change down to second and reduced the speed of the machine to about four miles an hour. On opening the throttle it immediately picked up and the top was engaged, but not before we were well

on to the gradient. However, the engine rapidly accelerated on top until just near the crest of the hill, passing over the summit still in top speed and with

Details of the sidecar suspension, the sidecar wheel springing, and the duplex tubes forming the rear member of the frame.

the engine not labouring in the slightest degree. We noticed that considerable improvement has been made in the design of the handle-bars, these being much wider than on the previous model. Altogether, the run on the new Matchless was a delightful experience, and we greatly look forward to a closer acquaintance with this machine on the road at no very distant date.

It must be distinctly understood that Messrs. Collier and Sons are not in a position to deliver any machines. This is merely the prototype of their post-war model, which they hope to deliver to the public very shortly after the cessation of hostilities.

## STILL MORE SPRING FRAMES.

STILL they come. *The Motor Cycle* campaign in favour of spring frames shows no sign of abatement at present. We dealt on November 2nd with the frame applied to the Allon two-stroke, and illustrate herewith another adaptation of the Alldays rear springing,

An adaptation of the Allon spring frame.

the difference being solely in the type of spring employed. In this instance, two springs of the coiled or helical type are used on either side, surrounding links on which the top of the rear frame is free to slide. Two springs take the weight of the machine and rider and two take the rebound.—Alldays and Onions and A. H. Johnson, No. 15,849, 1915.

**Compound Rear Springing.**

Another attempt at rear springing is the subject of a patent by T. Matthews, of Pengam, Monmouthshire (No. 10,712, 1916). This is designed to allow a backward as well as an upward movement of the rear wheel relatively to the frame. The rear stays are pivoted behind the bottom bracket, and also are capable of sliding backwards, this movement being controlled by a spring. It would be interesting to know what effect this movement would have on chain or belt or *vice versa*. The upper portion of the rear frame, made in one with the carrier, is hinged below the saddle, and carries at its lowest end two guide rods surrounded by springs.

Between these is a vertical tube, which slides over another tube mounted on a plate attached to that part of the frame which carries the axle. The last mentioned tube has an oil-retaining gland at its base. Upon these tubes and guide rods the frame must rely for its support, for otherwise the rear portion is hinged only. The saddle is shown supported on a spring pillar.

A design giving movement in two directions.

### TIMES TO LIGHT LAMPS. GREENWICH TIME.

Nov. 16th	...	4.39 p.m.
" 18th	...	4.36 "
" 20th	...	4.34 "
" 22nd	...	4.31 "

### Army Forage Department.

The Director of the Army Forage Department says that only district valuers are expected to travel in motor cars on their business, and the main work is done by cycle and motor cycle.

### More "Second-hand" Shows.

The organisers of the Agricultural Hall Show propose to hold exhibitions of second-hand motor cycles and cars in several different centres throughout the British Isles, viz., Manchester, Birmingham, Bristol, Glasgow, Edinburgh, and Dublin.

### The Government's Views.

The Motor Cycle Manufacturers' Union quietly called a meeting of its members to discuss the new order by the Minister of Munitions, and on Friday, Mr. Alfred Bednell, the secretary, interviewed the Government Department on the matter. We quote the result of his investigations in our editorial article this week.

### Rover Co., Ltd., Dividend.

The profits of the Rover Co., Ltd., for the past year, including the amount brought forward from the previous year, amount to £101,457. The directors recommend a dividend of 10%, less tax, absorbing £11,224, and the placing of £20,000 to the general reserve, £30,000 to the War Contingency Fund, and £40,233 to be carried forward to next year.

### "Rural England and the War."

Many motor cyclists, particularly Midlanders, are acquainted with the Cotswold district: they will therefore be interested to read the series of articles, "Rural England and the War," now appearing in *The Light Car*. The articles are written to show how this rural and beautiful part of the kingdom has contributed to the conduct of the war.

### Weatherproofing the Sidecar.

A fortnight ago we illustrated the latest 6 h.p. Enfield sidecar outfit equipped with a hood and screen, and in so doing mentioned that the latter fittings were now standardised. Some readers have written to the company imagining that these two luxuries are now included in the price of the standard models, and we are asked to make it clear that such is not the case, as the extra charge for hood and screen on either of the Enfield sidecar models is £4 19s. nett.

### Motor Scooters.

A type of motor becoming quite popular in America is a light four-wheeled type of trolley similar to those used by street urchins for tobogganing down slopes, but propelled by a Smith motor wheel, which is the American version of the Auto-wheel. Some of the cars are quite elaborate, having seats and wheel steering, while others are quite simple affairs.

### Petrol Licences.

New licences (free of duty) for the purchase of motor spirit for use in hackney and commercial vehicles, and in industrial processes, will be issued in November to holders of licences which expire in that month. *The new licences will cover a period of six months.* Applications for the renewal of a licence which expires in November should be made to the Petrol Control Committee, 19, Berkeley Street, London, W., between 16th and 25th November.

### Permits for Motor Cycle Manufacture.

When the Minister of Munitions issued his Order at the beginning of last week many manufacturers interpreted it in its blackest manner; but we have good reason to believe that there is a bright side to the Order, and that motor cycle manufacture *will not* come to a standstill. The Government is not an obstructionist, and the only difference will be that in future it will grant permits for all motor cycles which are manufactured. We have good grounds for stating that the permits will be issued freely.

### SPECIAL FEATURES.

THE FLAT TWIN MATCHLESS  
(Illustrated).

WITH A SIDECAR ON THE SOMME.  
FOUR MORE SPRING FRAMES.

### Nothing New.

Naturally, the second-hand motor cycle and car dealers up and down the country are strongly opposed to the second-hand motor show now being held at the Agricultural Hall. They, perhaps, rightly regard their own stocks of second-hand motor cycles as a miniature show in themselves, and, moreover, they go on all the year round.

### The Actress and the Motor Cycle.

Few ladies have been initiated into the joys of motor cycle riding in a more curious way than Miss Madge Titheradge. Having to ride a heavy man's machine across a plank before an enthralled audience would not appeal to many, but this experience has not deterred this lion-hearted actress in the slightest degree. She is going to order a machine of her own, and hopes to evolve some sensible leather riding suit like her stage one. She certainly might do worse than purchase a motor bicycle, but to wear anything like the *outré* costume she has to don at Drury Lane would, we venture to think, be a crime. There are plenty of well-designed ladies' motor cycling garments already on the market.

NOT TOO OLD AT 68! Mr. Uzzell, of Birmingham, is a fastidious rider in spite of his age. He was twelve months finding a motor cycle suitable to his taste, his final selection being a 2½ h.p. Royal Enfield two-stroke.

**Enemy-owned Company Wound up.**

The Bosch Magneto Co., Ltd., of 204, Tottenham Court Road, London, W., has recently been wound up under the Trading with the Enemy Act.

**Three New Flat Twins in Seven Weeks.**

Still another flat twin is described in this week's issue, viz., the 5.6 h.p. Matchless. This, incidentally, is the third entirely new design of horizontal twin described and illustrated exclusively in *The Motor Cycle* within the last seven weeks.

**No. 1 Petrol Commandeered.**

Judging from the quality of motor spirit that is allotted to motorists in these days, it is not difficult to imagine that "Shell" No. 1 motor spirit has been commandeered by the Government for a long time past, though the public notice is issued for the first time this week, notifying the public that such is the case.

**Prince a Light Carist.**

H.S.H. Prince George of Battenberg, who was married yesterday to Countess Nada Torby, is an enthusiastic supporter of the light car. In Wednesday's issue of our sister journal *The Light Car* there are two photographs of Prince George's Morris-Cowley coupé on which the honeymoon will be spent.

**A Motor Cyclist Volunteer Section for Northamptonshire.**

Motor cyclists in Northamptonshire who would care to join the motor cycle section of the Second Volunteer Battalion of the Northamptonshire Regiment should send in their names to Mr. F. W. Marriott, Market Square, Wellingborough, who will give them all the necessary information.

**So-called 1917 Models.**

It would be interesting to know just how much the constant references to "1917 models" has had to do with the decision of the Minister of Munitions to prohibit the manufacture of new motor cycles without a permit. Undoubtedly a good deal of harm has been done, and it is all the more annoying, since many of these "1917" models are in reality none other than 1914 and 1915 designs under a new guise.

**Cork Motor Cyclists' Annual Meeting.**

At the annual general meeting of the Cork and District Motor Cycle Club, held last week, for the election of officers, most of the present office-bearers were re-elected. R. S. Russell, to whom the club owes so much, is again the hon. secretary, W. F. L. Dooley as assistant, and the finances will again be looked after by H. P. Dobbin. Mr. Frank Daly was re-elected president.

The hon. secretary's report, which was presented to the meeting, had not a great deal to record. Owing to the present state of public affairs competitions were practically abandoned, only two events being held during the year. Another factor that has contributed to this inactivity is the fact that twenty-six of the members of the club are serving in the Army, and no inconsiderable part of the report was given up to a record of their work.

The usual dinner will not be held this year. Its place will be taken by a smoking concert.

**Fine for Unlighted Cattle.**

For allowing three cows to be driven on the road after dark without a light, in accordance with the new lighting regulations, Joseph Bower, of Holmgate, was fined £1 at Clay Cross. It appears that one of the animals did considerable damage to a sidecar by jumping on it. This is the first instance of a fine being imposed under the new regulations of which we have heard up to the present.

**Motor Cycles for Police.**

The North Riding County Council has approved of the recommendation to provide motor cycles for police officers in that Riding, at Stokesley, Malton, and Northallerton. At the latter place the police horses and traps are to be dispensed with. The machines are to have sidecars, and the cost of each is not to exceed £65. For the present, the forage allowance, amounting to £40 per year, is to be continued to meet the cost

of upkeep, including licence duty, repairs, and petrol, the cycles to be used for all police purposes and to remain the property of the Riding. At Malton an additional allowance of £25 per year is to be granted for the same purpose.

**Ninety-two Spring Frame Designs.**

In support of *The Motor Cycle* spring frame campaign, we illustrate and describe in this issue four further new designs of rear springing for motor cycles, including the Matchless and the Zenith. During the last two and half years no less than ninety-two designs have been published in these columns.

**Demand for Second-hand Motor Cycles.**

There seems to be a good deal of buying and selling of second-hand motor cycles at the present time, and in this connection it may be remarked that upwards of a thousand small advertisements of second-hand machines appear in *The Motor Cycle* each week—approximately double the number appearing in any other journal.

JOY RIDING IN THE LAND OF THE PHARAOHS.

There are not many sidecars in Egypt, but they are apparently being used to good purpose. The illustration shows a member of the R.F.C. and a Gippo "flapper" aboard a P. and M.

## ZENITH IMPROVEMENTS.

## A SPRING FRAME COMBINED WITH A SLIDING WHEEL.

ONE of the pioneer designers of the spring frame in the motor cycle world is Mr. F. W. Barnes, the works manager of Messrs. Zenith Motors, Ltd., Hampton Court, Middlesex. His first effort was the Zenette, the two side members of the frame being designed scissors fashion, each portion being separated from the other by coil springs. The idea was ingenious, and worked well, but the design in those early days (1908) was crude. The new Zenith spring frame follows the very latest practice, is simple, by no means unsightly in appearance, and most effective. Two long leaf springs are employed, the forward ends of which are attached to the rigid portion of the frame, while the rearmost ends are attached to brass plungers sliding in the tubes of the movable portion. This lower or movable portion, to which the rear wheel is attached, is connected to the rigid part by means of hinges attached to brass plungers sliding in the rigid tubes. The wheel, therefore, is free to move vertically, and to slide backwards and forwards, so as to preserve a constant belt tension in spite of the opening or closing of the expanding pulley on the engine-shaft. Great improvement in appearance has been brought about by fixing the mudguard stays, mudguard, and carrier to the movable portion of the frame, so that they all move in unison with the wheel, and consequently there is not that ugly gap between the rear mudguard and the wheel at present to be seen in the Zenith when the highest gear is in engagement.

**An Ingenious Self-adjusting Brake.**

The sidcar attachment, which on an ordinary machine would be a clamp fixed to the near side chain stay, is a casting slipped over the spring and pushed forward as far as it will go. This is

Valve side of the newly designed spring-frame Zenith.

quite secure, and just allows of sufficient movement of this portion of the spring, which is, of course, very slight at this point.

Rear brake mechanism, showing method of its adaptation to the sliding Zenith wheel.

Another important innovation is the new method of operating the rear brake by means of a rod instead of a Bowden wire, a piece of designing which was by no means easy to carry out in the case of a machine in which the back wheel is free to slide backwards and forwards.

**ANOTHER SPRING FRAME.**

Belt side of new 8 h.p. twin-cylinder Zenith-Gradua, the rear portion of which is suspended on laminated springs.

The difficulty has been got over in the following manner. The long pedal operating the brake is provided with a stop, so that it flies back into the correct position, and is connected to a long rod curved upward at its rearmost end and hinged to a point close to the rear spindle. This flat rod or bar passes

Rear view of springing system adopted on latest Zenith.

through an adjustable yoke, in which there is a roller engaging with the bar. On the pedal being depressed the bar is lifted, presses the adjustable yoke upwards, which is connected to the brake shoe, and brings it up against the belt rim. This brake shoe is self-adjusting, an excellent feature of the Zenith brake, which has been in use for some little time, and allows the shoe to have a

**Zenith Improvements.—**

perfectly parallel motion, thus engaging the rim evenly and exerting the maximum degree of stopping power. This device was seen more clearly on a 4 h.p. Zenith (85.8 mm. x 85 mm.), which was built to the order of the Russian Government. It was a standard clutch model, but possessed the important improvement just described. On this machine the instructions, on the clutch, "Oil here freely," are written in Russian as well as in English, and this is the case also with the instructions as regards the operation of the gear, which are to be found on the top of the tank.

An interesting experiment we noticed in the Zenith Works was a pair of channel steel forks, which are much lighter than the ordinary forks, stronger,

The priming device on the 8 h.p. twin Zenith.

and on account of their smoothness in design, far more easy to clean. Though engaged mainly on war work, Zenith Motors are not neglecting their experimental department, and when new machines may be freely delivered the

post-war model will be a thoroughly up-to-date machine, but in no way an untried model.

We had a very enjoyable little run

Details of the method of springing the back wheel of the new Zenith.

on the 8 h.p. spring frame combination, and were greatly impressed by the smoothness with which it rode. Shortly after leaving the works, Mr. Barnes, who was riding in the sidecar, asked us to be sure and keep well in the centre of the road, so that we could drive over the maximum number of pot-holes, and at the end of that particular stretch we were compelled to ask him where the pot-holes were; they were certainly not noticeable. The machine was tried over varying road surfaces, and certainly up to the present it is one of the best spring frames we have ridden. Naturally over exceptionally bad surfaces there was a good deal of motion, but all small indentations are entirely absorbed by the springs and are not noticeable, while the larger ones, though they threw the rider about, certainly eliminated the severe shocks which on an unsprung machine would be quite unbearable.

On the 4 h.p. model Zenith a new rod-operated foot brake is fitted. The machine illustrated was supplied to the Russian Government.

## Average Prices OF Second-hand Machines.

WE give below the average prices of second-hand models offered for sale in *The Motor Cycle*. Where it is possible to obtain a sufficient number of each model the average for the past week is quoted, otherwise the last average is given, if within four weeks.

**LIGHTENING PISTONS.**

Those of our readers who wish to lighten their pistons and connecting rods to the utmost will be interested to hear that a British firm, Messrs. Bramco, Ltd., can now supply Magnalite castings to drawings or patterns.

Magnalite is an alloy which is said to be lighter than aluminium itself, and to possess high-tension and compression strength. This alloy has been largely used for racing pistons in America, and is standard on several cars.

## WITH THE "TANKS."

WE extract the following paragraph from a communication received from a gunner serving with the heavy armoured cars in France:

"We appear to have created quite a sensation in the old country from all accounts, and I can personally vouch for the look of utter dismay on the part of our nice friends the enemy when they see the 'Tanks.'

"It was very hot for an hour or two, but as soon as we got over their lines they thought it time to do a disappearing trick. They absolutely poured shrapnel, machine-gun bullets, and hand bombs at us, but all to no purpose; except for a scratch or two from bomb splinters we arrived through without a scratch. We had nearly a fortnight within the shell fire zone, and as our position was surrounded by batteries of all kinds, things were most interesting at times.

"The artillery fire from our side is wonderful, and really one feels sorry at times for dear old Fritz; however, one's sympathies very quickly cool down when he starts to send the 'rations' across about supper time. For ten days he cleared us off to bed regularly every night at about 8.45 by a few nicely-placed 'ones,' and generally he kept going until a little after midnight. In spite of all this you will be pleased to hear that, as a rule, I slept the sleep of the just. You should just hear the racket when perhaps things have been quiet for an hour or two; all of a sudden every gun blazes away for all it is worth, and until you get accustomed to it the noise is simply deafening."

A Balkan scene, showing motor despatch riders interested in *The Motor Cycle*. (See letter.)

## WITH THE EAST AFRICA E.F.

DRIVER W. MILES-THOMAS, who is serving with one of the motor batteries of the M.M.G.S. with the British East African Expeditionary Force, writes as follows:

"I wrote you last while I was in hospital at Nairobi getting over an attack of fever. I rejoined the battery at Kondoia Irangi, and two days later we set off southwards again. On the run from there to here (—) we did jolly good work, as the road was quite good, and the Staff say we speeded up the advance over the 110 miles very much. We have run over mines in the road, but no casualties as yet. The entrance into this place was quite spectacular. When the German cavalry saw us in extended order on top of the ridge five miles back they put up the white flag, and retreated still further away from the town. Then we and the S.A. motor cyclist corps (rather a ragtime crush, who can't ride for toffee) rushed in, and there was great competition to be the first Britisher to cross the German cross-Continental line. Anyhow, our captain took over the proclamation, and we hoisted our own little Union Jack used for signalling, and pulled down the white flag. Now we are resting here awaiting supplies and orders."

A NOTE FROM THE  
BALKANS.

WE have received from a reader in Jersey, the accompanying letter and photograph, which shows the nature of the shrubby country of the Balkans, and incidentally gives a slight idea of the tracks our men have to traverse with their motor cycles, the one in the illustration being a War Office model Douglas:

"I have been asked to send you enclosed snapshots of two motor despatch riders in the Balkans, enjoying a rest and reading *The Motor Cycle*.

"They wish me to say how very much your paper is enjoyed in that part of the world:

"The two despatch riders are Cpls. L. R. Evershed and P. Austen, of the 28th Divisional Signal Company, Salonica Army."

IN THE COUNTRY OF THE  
RHINOCEROS AND LION.

FROM the remotest outposts of our Empire we frequently receive letters in which the writer shows his surprise at finding the blue-covered *Motor Cycle* in such distant and outlandish places. We have always aimed at catering as much as in our power for the reader Overseas, and, as a result, the journal is as much a friend of the Colonial as the home motor cyclist. The following letter from German East Africa gives a brief but graphic sketch of the conditions in that country:

"It may interest you to know that your paper has found its way out into

Cpl. Herring, the runner, of the London Athletic Club, now serving with A.S.C., M.T., in East Africa. (See the accompanying letter.)

this awful part of the world. I was very delighted when I came across an old copy of *The Motor Cycle*. It was certainly an old one, being dated November 4th, 1915, but it is as full of interest to me as it is when I am at home (South Africa). This country is nearly all swampy jungles, so the postal service is far from what it ought to be; we have not had any papers for nearly seven months. The despatch riding out here is done mostly on Douglas machines, and quite a lot of B.S.A.'s are used as well. It is really wonderful how they are sticking it, for they have to go hundreds of miles over 'game tracks,' and often it is simply cross-country riding. Generally speaking, the despatch rider has a pretty rough time when he is on a trip, having to keep a look-out for enemy snipers, and also keep his eyes open for all sorts of big game, such as rhinoceros, lions, tigers, and snakes.

"Wishing you and your paper the best of luck.

"P.S.—Enclosed is a small snapshot of Cpl. Herring, the runner from the London Athletic Club now serving with the A.S.C., M.T., in East Africa, on a Douglas."—(Cpl.) C. H. SMART.

## THE "SECOND-HAND" SHOW.

Motor Cycles well Represented at Prices well up to the Average.

TWO EXAMPLES OF FAMILY SIDECARS ON VIEW.

The two-seated adult sidecar on the left is fitted to an American Excelsior machine, and is really a four-seated outfit, as the bicycle has a pillion seat.

The above sidecar has a seat in front for a child, and is fitted with double screens. The springs appear to require setting up.

"BUYING a pig in a poke" is a very old saying. To render such a possibility unnecessary is the object of the show of second-hand cars and motor cycles organised by Messrs. William Glass and Co. The exhibition now being held at the Royal Agricultural Hall, Islington, London, N., is drawing a fair number of visitors. This is not surprising, since the demand for modern motor vehicles of the economical class has been most pronounced ever since war broke out, and prices have consistently increased, and show no signs of coming to a halt. It was fortunate in some ways for the promoters of the show that the Minister of Munitions should have issued on the Tuesday previous to the opening an Order in regard to new vehicles which was interpreted in many quarters as exceedingly drastic, but which, we have good reasons to suppose, is not so severe as was at first imagined, for permits are to be issued freely in suitable cases. This Order laid down that no further motor cycles or cars may be made after the 15th November without a permit from the Ministry of Munitions, the Army Council, or the Admiralty. The natural effect is that existing vehicles are rendered more precious than ever, and those who visit the Agricultural Hall this week will therefore not be surprised at the absence of real bargains. The motor cycles represented form quite a good show, though the makes are not so varied as one might have imagined. Whereas quite a number of prominent patterns of machines are absent altogether, other brands have six or seven representatives.

### An Examiner's Certificate.

On Thursday there was supposed to be a press view of the exhibits, but there were very few vehicles in the hall even on Thursday afternoon, though the entrance was crowded with vehicles, the examiners being extremely busy getting through their work. All the motor cycles are examined by Mr. R. G. Mundy, who tests each vital part for

wear, and subsequently attaches a certificate of condition. Quite early Mr. Mundy discovered a motor bicycle with a fractured frame, and we heard, too, that a car with a real blemish had the weak portion smeared with thick oil. This, however, at once aroused the suspicion of the examiner, who removed the oil and the secret was out! The examining system, if performed really thoroughly (and particularly if it were possible for the examiners to have a short trip on each vehicle), is quite a good idea. It dispenses with the need for a salesman, whose attentions may be far too pressing. With a reliable certificate a buyer is able to consider his

purchase at leisure, and, should he decide to buy the machine at the price stated in the catalogue, he proceeds to the sales office and effects the sale. There is a reserve on every machine, so that a man may, if he chooses, make an offer. On Saturday there is to be an auction sale of any vehicles not disposed of.

### Entries Arrive Late.

Even on Friday the show was not full, but vehicles were still coming in, for Mr. Glass announced at the press luncheon that the pressure of entries grew rapidly last week, and that it might be necessary to put some of the

Every machine exhibited had attached to it a certificate of condition, the result of a personal examination by Mr. R. G. Mundy, who is seen above with note pad in hand.

### The "Second-hand" Show.—

motor cycles in the gallery. A certain number of late entries of older vehicles had been refused.

There was only a sparse attendance on Friday (it was half-crown day), but even in the morning several sales had been effected, and, after all, the actual sales will decide the success, or otherwise, of the show. There was quite a good sprinkling of khaki men among the visitors, and one of the first persons we met in the show was Eric Williams, the winner of the Junior T.T.,

A neat locker in the nose of a sidecar fitted to one of the exhibits. The door was inclined at an angle, so that it suggested a convenient place for a clock or speedometer, as well as the switch shown.

and lately a despatch rider in the Royal Engineers, Signal Section. He has just been discharged from the Army after several months in hospital.

We cannot congratulate all the exhibitors on the manner in which they have prepared their machines for exhibition. Flat tyres were quite common, sidecar aprons were hanging in slipshod fashion in the body of the sidecar, and a number of sidecar exhibitors, too, had obviously strained the springs badly, the bodies in some cases being in such a position that anyone sitting in the sidecar would run a great risk of slipping forwards off the

A Zenith with an 8 h.p. overhead valve J.A.P. engine. The straggly exhaust pipes at once attract attention.

seat. Rust, also, was far too prevalent. Then, again, comparing the machines with the statements in the catalogues, one was bound to pause on occasion. For instance, one machine was reputed to have covered a thousand miles, according to the catalogue, but the state of the tyres and enamel was by no means a compliment to the exhibitor or the rider, if such a mileage was anywhere near the mark. Again, there were some examples of sidecar misfits, whilst in other cases the colour schemes formed a striking contrast.

### A Variety in Sidecars.

Nevertheless, the exhibition, as a whole, is most interesting, if only as a study of the condition of machines after two, three, or four years' use on the road. There were low-built sidecars, high-built sidecars, lightweight sporting sidecars, and family sidecars. In the

case of some makes having a number of representatives, the comparison of the different years' models proved instructive, and in this connection it was an excellent plan on the part of the organisers to

A supplementary tank with a pointed tail, as fitted to one of the Red Indian machines in the Show. The usual tank is, of course, used for petrol substitute.

group the different specimens of any one make together to render comparison easier. In short, the Second-hand Show is quite interesting, and we shall be surprised if it has not come to stay.

### Latest Entries of Motor Cycles.

In our last issue we gave a list of the motor cycles to be exhibited, and since then the following have been added:

ALLON	1
B.S.A.	4
BRADBURY	1
CALTHORPE	1
CHATER-LEA	1
CLYNO	1
COVENTRY EAGLE	1
DIAMOND	1

ZENITH	2

Near the main entrance there is a stand for the Auto Cycle Union. Hereon the Tourist Trophies and other special cups are exhibited, recollections of the competitions for which even now produce a tremor in the heart of the enthusiastic motor cyclist.

A general view of the Agricultural Hall Show. The motor cycles occupy the two outside rows of stands, whilst the cars are staged on the four central rows.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," Herford Street, Coventry, and must be accompanied by the writer's name and address.

#### Motor Cyclist Volunteers.

Sir,—With reference to your article *re* volunteer motor cyclists, I should be glad if you would insert this letter in your columns asking if there are any Volunteer Corps in Brighton or district requiring motor cyclists.

I am sure that there must be many motor cyclists in this town, who, like myself, are ineligible for the regular Army, but would like to do something in which their motor cycling experience would come in useful.

I am sure that there must be many motor cyclists in section at present attached to any of the Volunteer Corps here, there would be no difficulty in raising one.

LEWIS C. CAHON.

#### Boycotting German Goods.

Sir,—Allow me to add my humble tribute of appreciation to your declaration of the attitude you propose to take regarding goods of enemy origin after the war. It is timely and commendable, and it is to be hoped your lead will be followed by others highly placed, especially manufacturers. It is in their hands that the solution of the matter lies. The average purchaser, after all, can hardly be expected to refuse a machine which in every way suits him merely because it has a German magneto, or because there is a band of German steatite round the plug, or because there is a German inner tube in the back wheel. It is for the people who have in the past incorporated these things in their products to see that there is no repetition in future.

The question will not be a very simple one. We have to remember that we are dealing with the wily Hun, and it is quite on the cards that if we confine our attention to goods from Germany and Austria we shall one day find that Mr. Bosch, for example, has transferred his works to Holland, Denmark, or Sweden, and that we shall be receiving the same rotten eggs in a different basket.

It would appear that the time is opportune for the leaders of England's motor industries to put their heads together and make up their minds what they intend to do. Only concerted action can lead to any good result; otherwise they will all be at sixes and sevens. Many, on the score of cheapness, laziness, or sheer unpatriotism, will return to their old and contaminated sources of supply, and, here is the crux of the question, provided the goods are serviceable and are the cheapest, whether they come from Germany, China, or Timbuctoo, they will find a ready market.

Cairo, Egypt.

H.S.

#### "Flat Twins on the Bummel."

Sir,—Under the above heading "Ixion" has certainly scored a victory—at least I think so. To those, like "Ixion," who have tried and those who have scorned flat twins the following may be of interest.

I have ridden 1912, 1913, and 1914 twins an average of 7,000 miles each, 3,400 miles of this with sidecar, on a repair and running bill which, I believe, very few could better. None of these machines "chewed up chains and chain wheels," although the 1914 did 8,700 miles. I had one spare chain, which did work on all three, and was passed on to the fourth.

There is a point overlooked by some, viz., that a "revving" engine needs less attention to valves and piston rings, etc., than the single, due to the mixture having little time to escape; at the same time "revs." keep valves in order. Now I have at present an August (1915) 2½ h.p. three-speeder with *adjustable pulley* (the most useful and

educating part of the machine). It has to date run 4,500 miles faultlessly, over 3,000 of this with sidecar. I have not yet had to grind a valve. The engine has been cleaned twice internally, the last time within 1,000 miles, to see the effect of paraffin mixtures. It has not been coddled, having been over Rest and be Thankful, Kirkstone, and Honister with sidecar. It does 15 m.p.h. with sidecar on single-figure gradients with absolutely no vibration. Vibration on flat twins is, I think, a question of carburation more than oiling, as suggested by "Ixion." With faked carburetter it gives power and economy, 85 m.p.g. with sidecar (jet 28, Amac).

From the foregoing and experience dating from 1903 I am convinced that, given a single and a flat twin with not less than 3,000 gruelling miles (the more the better), without any grinding of valves or cleaning of cylinder, and send them both over broken country, I would back the flat twin every time.

Mr. Huskinson unwittingly paid the flat twin a great compliment when he said, "Take away the gear box," etc. Why, it is through the gear box that we have a light, handy, go-anywhere and pull-anything mount. With reasonable treatment the latest 2½ h.p.'s are more than a match for the average 3½ h.p. singles, especially if the sidecar is attached. This is my experience. All credit to Douglas Bros.

W. HUTCHESON.

#### Bearing Pressures.

Sir,—With reference to Mr. Bonython's letter *re* my article. Taking the points he raises in order:

(1.) I do not think for obvious reasons any engineer would care to take a piece out of the rim of a flywheel. This leaves us the alternative of larger flywheels.

(2.) The area of the big end bearing of the medium-stroke engine, on the given pin diameters, is three-sevenths greater than the long stroke. The slightly greater speed makes little difference. Arguing on the line given by your correspondent, we should assume the smaller the bearing the better.

(3.) If the connecting rods were of the length suggested, viz., five times the crank throw, the rod of the 120 mm. stroke engine would be 300 mm. between centres, i.e., nearly 12in. The other would be 240 mm., or nearly 2½in. less. Of course, either length could not be accommodated on a motor cycle, and is impracticable, but when we have allowed this rod for the long stroke, *plus* a bigger flywheel, the size of the engine would be formidable. Hardly the one for motor cycle work. However, reverting to the existing rods. As both the rods are of the same centre actually, the deductions arrived at and stated in my article are correct in actual practice.

(4.) This point, to my mind, is an obvious fallacy. Mr. Bonython has apparently lost sight of the fact that, although the stroke is longer, the bore is smaller, therefore the pressure exerted is proportionately less than the medium-stroke engine. It is only another way of balancing levers. A long lever with a small weight will balance a short lever with a greater weight.

(5.) The speed of the crank pin cannot, of course, be the same at the same engine revolutions in both cases, and I must draw your correspondent's attention carefully to the end of the article, as I think this explains as clearly as can be the whole matter. How I *suggest* anything, as your correspondent states, is not clear.

In conclusion, the letter seems to me to have wandered far from the actual facts of the case as I have set them out.

A.A.S.

### Favourite Machines.

Sir,—Being a constant reader of your paper, I have much enjoyed the different letters comparing the respective merits of the British machines and the American ones.

In Belgium, I have ridden many machines of different makes, and think that for fast and sporty riding nothing can compare with the good  $3\frac{1}{2}$  h.p. single (T.T. Singer or Triumph); for sweet, vibrationless riding the big four-cylinder 7 h.p. F.N. is unbeatable; whilst for sidecar work the James is second to none.

Here in Holland, where I am interned now, they seem fond of the big American twins, and generally ride them solo. For this work my ideal here would be a Douglas, a little F.N., or a good two-stroke. Any one of these machines would take you everywhere.

Wishing your valuable paper (I expect it eagerly every week) all the success it deserves, **ENTHUSIAST.**  
Rotterdam, Holland.

### Motor Manufacture under Permit.

Sir,—In your comment on the new Order you say, "The new Order will put everybody on a fair basis." This is not the fact. The firms which are fully occupied with Government orders for cars and cycles will have a distinct advantage. They will maintain their output, and will make (as they are making) large profits. Firms whose cars or cycles are not purchased by the Government will have to dismiss their staff, their business will be entirely disorganised and they will suffer serious loss. Moreover, the firms which continue to manufacture will gain experience, while those which do not will fall behind. I need hardly point out that this means also a distinct gain to the foreigner. Moreover, the non-manufacturing firms will be left with large stocks which they cannot use or dispose of. Many firms have on their hands a number of partly completed cars, built to order and on which deposit has been paid, which cannot now be completed till the end of the war. Your article seems to imply that all firms can find employment under Government, sufficient to keep their works fully occupied. This is not so. If the Government will supply all firms with sufficient work to run their works at a reasonable profit (they do not expect pre-war prosperity), and will not compel them to scrap or keep unused much valuable stock, there will be less hardship. Even then the firms which continue to produce cars will have an enormous advantage over those which do not. It is mostly the smaller firms which will suffer. They will accept the position willingly if the interests of the country require it (which they doubt), but they will not agree with you that they are being treated fairly, or that the new Order will put them on a fair basis.

Malvern Link. **H. G. MORGAN.**

[We direct attention to the leading article in the current issue. If the expectations of the Motor Cycle Manufacturers' Union are realised, the situation will be considerably alleviated.—Ed.]

### The Motor Cycle in Australia.

Sir,—We note the letter from Lt.-Col. C. MacLaurin, A.M.C., A.I.F., in your issue of July 20th. We agree with that portion of the colonel's letter where he states the main roads about Sydney are as bad as can be, but we cannot agree with him that the roads in most other parts of N.S. Wales are quite decent.

During June and July it was almost impossible to use a motor cycle for any distance in any part of N.S. Wales, the roads being so bad owing to recent rains. Even under ordinary conditions there are but few good roads in this State.

The colonel also mentions that, owing to English manufacturers appointing but one agent in each State, motorists are left "like sheep in the hands of the shearer," etc., and in some cases have to pay an advance of 60% or more on English list, etc. We can only say the colonel's experiences must have been unfortunate. He evidently overlooks the fact that in the whole of N.S.W. there is less than one quarter of the population of London. If English manufacturers appointed, say, half-a-dozen or more agents in each State it would not be worth any agent's while to push the machines or keep stocks of spares. We are N.S.W. agents for Triumph, Rudge, and New Hudson motor cycles; at the last stocktaking we had on hand spares totalling in value £4,500 for these machines.

It will also no doubt surprise the colonel to find that the profits made here on British motor cycles and spares are very fine indeed, so fine that we have no hesitation in saying that in no case do we make a gross profit of 25% on an English motor cycle. Out of this percentage, sub-agents' commission, advertising, and general overhead expenses have to be paid. Further, British motor cycles are usually sold here at lower prices than the same machines can be imported by the motorist himself. The duty alone on a  $3\frac{1}{2}$  h.p. or 4 h.p. single-cylinder machine is from £13 to £14. It therefore costs at least £20 to land this class of motor.

**BENNETT AND BARKELL, LTD.**

Sydney.

[Accompanying the above letter were reproductions of photographs of New South Wales roads revealing the truth of our correspondents' statements, and never in all our experience have we seen worse examples of main roads. The Automobile Club of Australia is endeavouring to get Parliament to create Road Boards for all districts, as it is found that wherever these boards have been set up an immediate improvement of the roads is a certainty.—Ed.]

### Flat-faced Valves.

Sir,—The letter of George Lewis, page 415 (November 9th), raises an interesting point, viz., the substitution of flat-faced for bevel valves. Of the many motor cycles I have owned, as far as I can remember, three had flat valves—an ancient Fafnir, N.S.U., and Humber. In these three machines the valves gave no trouble; there was never a thought about grinding in, distortion of seating, nor "lipping." The power was ample for touring purposes. I have often wondered why the flat valve has not been universally adopted for utility mounts. From an efficiency point of view it appears that the gas enters and leaves the cylinder with freedom. I have heard it said that flat valves bounce and require unduly strong springs. This may be so or it may not; no one can say with certainty what happens. I have never seen a tracing to prove or negative this assertion. If there were a certain amount of bouncing at racing speed it would probably not be evident under touring conditions, and as the motor cycle of to-day has become a business man's necessity, reliability and a negligible bill for repairs should outweigh the doubtful advantage of slightly increased speed.

On Military Service.

**CUTTY.**

### Why Does the Engine Carbonise?

Sir,—I have read with great interest the article of Mr. H. Webster Moss in the issue of *The Motor Cycle* for October 12th, and I endorse his explanation of the engine's carbonisation. Let me describe for your readers a little device I have imagined, in order to apply easily Mr. Webster's remedy for carbonisation. As seen in the article,

A French reader's idea of vaporising heavy fuels by utilising heated gauzes in the induction pipe.

the idea of your contributor is to have an exhaust-heated tube leading through the induction pipe, and my device would be an improvement on that idea. It is also, I think, a simple vaporising device for the heavy fuels. The tube from the exhaust pipe passes first through the induction pipe, as close to the carburettor as possible, and then returns also through this pipe, leaving a space of a quarter of an inch between the two parts of the tube. In the interval two fine gauzes would be located, being forced against the tubes with two leaf springs, as shown in the sketch. I think the gauzes would be heated by the two tubes and the petrol particles of the gases be well evaporated before reaching the cylinder.

**RENE CAMUS,**

Médecin Chef, French Army.

## Brampton Fork Improvements.

Improved type of Brampton fork.

MESSRS. BRAMPTON BROS., the well-known Birmingham makers of many motor cycle parts, notably spring forks, have introduced several improvements to their standard models. Previously the Brampton fork had only one central pair of horizontal springs at the top, but recently this has been improved upon, and the top of the fork is now fitted with their patent double spring couplings: a heavy spring to take the direct shocks, and a lighter spring to take the rebound.

The method of attaching the side links is good; the left and right-hand links are tapped with left and right threads respectively, and the spindles on to which they screw are threaded to correspond. Each spindle can be turned by the squared head on the left side, thus pulling the links into adjustment. A reasonable margin of play should be allowed by slacking back a half turn from the tight position, and when the outside lock nuts are tightened up, the whole link motion is as rigid as can be desired, whilst perfectly free in action. Lubrication is well provided for, with oil holes and spring covers to all necessary

bearings. It forms, without doubt, an excellent spring fork, giving the maximum of comfort, and its adoption by a number of the best known motor cycle firms, notably the A.J.S., Sunbeam, and Clyno, is sufficient guarantee of its excellence.

Brampton method of fixing spring fork links with right and left threaded spindles.

## THE G.K. SIDECAR.

AT the present time, when economy is so essential, any form of sidecar which will perform two purposes is sure to be popular among a large percentage of our readers. The latest form of G.K. sidecar can be used as a pleasure vehicle and also as a tradesman's carrier, and the conversion can be effected in a very few minutes. The upholstery is buttoned on to the body, and when the upholstery is in position the outfit looks just the same as any ordinary sidecar. It is claimed that the upholstery can be removed or attached in ten seconds.

When detached it folds away neatly, and stows into the locker in the bulbous back of the body, together with the seat cushion. The lid is then closed, and ample space is provided for the storage of all sorts of goods or merchandise. When the upholstery is in position the locker at the back of the body is sufficiently spacious to carry two petrol tins and other items. Although the coachwork is made specially strong so as to carry weighty goods, the whole sidecar only weighs 112 lb. complete, the body only weighing 50 lb. The makers are the G.K. Sidecar Co., Lorenzo Works, Lorenzo Street, Pentonville Road, London, N.

## FOR BUSINESS AND PLEASURE.

A double purpose G.K. sidecar, which can be converted into a business vehicle by easy removal of the upholstery, the bulbous portion forming a useful locker for storing purposes.

## THROTTLE CONTROLLED LUBRICATION.

MEANS of linking the mechanical lubrication or semi-automatic drip feed with the throttle, so that as more power is given by the engine

Throttle controlled lubricator

more oil is supplied to it, are becoming more common. Such connecting up was foreshadowed by *The Motor Cycle* more than two years ago, and no special difficulty is involved in carrying it out.

In the method under review (the patented invention of A. S. Baylis, No. 101,504/16) the means adopted are very simple. The throttle barrel carries a second Bowden wire which extends through the base of the carburettor and operates the needle valve of the oil controlling device. The oil so delivered may pass to the crank chamber and be splashed to the various bearings, or it may be pumped direct to the bearings or other part where it is required. This is combined with a hand pump by which an extra supply of oil can be given to the engine at any time.

## THE C.C. SPARKING PLUG. A Design enabling the Points to keep Clean and Cool.

AN interesting article entitled "Over-heating and Sparking Plug Design," in the issue of October 26th, by "H.A.B.," has caused the inventor of the C.C. sparking plug to call attention to his device, which, he claims, supplies the long-felt want suggested in that article.

The C.C. sparking plug and its accompanying fittings, manufactured by the C.C. Sparking Plug Co., 5-7, Old Queen Street, Westminster, S.W., is an ingenious form of plug, in which the general construction of the central elec-

The three-way distributor screwed into the induction pipe, and the adapter for ordinary sparking plugs.

trode and its porcelain insulation follows standard lines, but the second or earthing electrode takes the form of a tube which passes in at an angle through the body of the plug. This tube is connected by means of a union, below which there is a ball valve, and a small bore pipe to the two-way union screwed into the induction pipe, also provided with a ball valve. The object of the first ball valve is to prevent any pressure within the cylinder passing up the pipe, while it allows free ingress for a portion of the mixture from the induction pipe to impinge directly upon the central electrode. Now the mixture, of course, contains a large percentage of petrol, consequently it possesses cleaning properties, and it is also cool on account of the vaporisation. There is no lower seating for the ball, its downward path being checked by a pin through the centre of the tube, which can be seen in the illustration. The second ball

C.C. sparking plug, showing device for cooling the electrodes.

valve is merely intended to come into action in the case of the first ball valve failing. Into the top of the union screwed into the induction pipe is inserted a compression tap, through which priming may be effected, or it may be left open as an extra air device.

It was demonstrated to us on a small plant consisting of a series of sparking plugs and a coil that an excessive amount of soot, though it may not lead to a dead short, allows a certain leakage of current, while through a clean plug there is no leakage at all, consequently a dirty plug would cause a poor spark across the plug gap. It is therefore to the interests of the motor cyclist to keep his plug as clean as possible, and the C.C. sparking plug should certainly go a long way towards helping to do this.

An adapter may also be used whereby an ordinary plug can be fitted and have practically the same effect as the special sparking plug we have just described.

## TRIAL OF THE PARKER VAPORISER. A Simple Method of Breaking up the Mixture.

OF the various simple fitments alleged to assist carburation which we have tried the Parker vaporiser seems to us to have one of the best chances as regards permanency; but it certainly might more adequately be termed a "gas mixer" than a vaporiser.

The latter word rather suggests a fitment which is quite needless except when using a heavy fuel, whereas Mr. Parker's simple fitment is primarily intended to break up the charge, which end is desirable, even with petrol.

All who have experimented with heavy fuels have experienced that uneven running and unsteady pulling which indicated a mixture of varying density, and the object of this fitment is thoroughly to break up and mix the charge between the carburetter and the engine. The device was described on page 248, September 21st issue, and consists merely of a series of deep-toothed cog wheels screwed on to a hollow brass stem, the whole compact fitment sliding into the induction pipe at the point where it joins the cylinder.

### A Remedy for Uneven Running.

We recently tested this device, both with heavy fuels and with petrol, and are able to say with some confidence that it undoubtedly improves the running of the engine. The tests were made on a 3 h.p. twin-cylinder engine, tuned more for speed than for steady pulling, the vaporisers being merely pushed into the induction pipe at five minutes' notice. Hitherto, the engine has proved rather uncontrollable at low speeds, even with petrol—probably owing to the long and narrow induction pipe—and the inclusion of the vaporisers has made a consider-

The Parker vaporiser and flange by which hot air is conducted to the carburetter.

able improvement at low speeds. It is also noticeable that, in addition to improved elasticity, the vaporisers appear to have sweetened up the running of the engine, which should indicate reduced wear and lower consumption.

The accompanying illustration—showing how the charge in the induction pipe may vary in density in accordance with the position it occupies—helps one to realise that if the charge be mixed as it rushes through the induction pipe a cleaner and sharper explosion may be expected.

When heavy fuels are employed and it becomes necessary to heat the gases as much as possible, a brass flange can be placed under the induction pipe. This encircles the cylinder and not only assists in warming the induction pipe, but also can be made to transmit hot air to the carburetter via a curved pipe.

Sketch showing how the charge in the induction-pipe may vary in density in accordance with the position it occupies.

Heavy fuels tend to give a very wet charge, varying in "wetness" or density, and therefore a super-atomiser or mixer is desirable. Judging from our own experiences, this simple and inexpensive fitment should meet with the approval not only of the fuel economist of to-day, but with the speed man of to-morrow, as our fears that the slight obstruction in the induction pipe might interfere with the "revving" capabilities of the engine proved unfounded. The idea is good!

The patentee is Mr. W. Parker, 435, Little Horton Lane, Bradford.

## IMPORTS AND EXPORTS.

THE prohibition order of importation of motor cycles is, of course, still in effect, and, although completely assembled machines do not now find their way into this country, tyres and accessories are still imported. The exportation returns for October have almost doubled those of September, and also show a big increase on the numbers given for the corresponding period last year.

### IMPORTS.

	October, 1916.	September, 1916.	October, 1915.
Number .....	—	—	314
Value of complete machines .....	—	—	£13,888
Value of tyres and parts .....	£3,660	£9,215	£9,273

### EXPORTS.

	October, 1916.	September, 1916.	October, 1915.
Number .....	1,497	746	880
Value of complete machines .....	£75,950	£31,700	£38,257
Value of tyres and parts .....	£29,460	£28,130	£26,568

### Petrol Figures.

The amount of petrol imported this month shows an increase of 3,000,000 gallons on the September figures, and 1,000,000 gallons increase compared with the corresponding period last year.

	Gallons.	Gallons.

# QUESTIONS AND REPLIES

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

## Cleaning the Crank Case.

**?** Would you be kind enough to tell me the best material with which to clean motor cycle crank cases? I have boiled mine in strong soda water, and it has not done much good. Instead of cleaning off all the oil and dirt and making it nice and white, it has turned it black. I once had a crank case repaired, and I asked the repairer to clean it, and when it was returned to me it looked just like a new one, nice and white. Can you tell me how this was done?—C.E.S.

We think the best way to clean your crank case is to wash it in paraffin. Any solidified oil will have to be scraped away. It is possible that when you had your case repaired it was cleaned by means of sandblasting, which, of course, requires special appliances.

## Timing Fixed Ignition.

**?** I have an A.C. cycle car with fixed ignition, and have removed the magneto for repairs. I now want to replace it. Will you kindly tell me how to set the timing? What should be the exact position of the piston when the contact points are about to break?—A.F.S.

You should arrange for the ignition to be as far advanced as possible consistent with satisfactory running and freedom from backfiring or knocking. You do not state the type of your machine and the engine dimensions, so we are unable to give you very accurate measurements. We would advise you to proceed as follows: Turn the engine till the piston is on top dead centre (firing stroke), then turn the engine slowly backwards until

the piston has descended about 6 mm. This can be easily ascertained by inserting a piece of wire through the compression top. Couple up the magneto and see how the engine runs. You could then experiment a millimetre at a time one side or the other of this setting.

## Increase of Speed on turning off Petrol.

**?** (1.) In your issue of September 14th, page 233, a correspondent, F. A. Holward, gave particulars of altering a Villiers two-stroke to run on paraffin.

Could you please say if oil would mix with the paraffin (half a pint to one gallon) and work under conditions suggested by Mr. Holward? (2.) I always turn my petrol off about one hundred yards before I stop, and I find immediately I shut off petrol—that is, from the tank—the engine runs much better and increases speed 25%.—W.J.W.

Provided you have some method of vaporising the paraffin fairly well, you can mix oil with it in the usual manner quite satisfactorily. The method suggested by Mr. Holward is quite good, and should allow the fuel and oil to be mixed quite all right. A slightly larger jet may be required, however. The most likely reason for the improvement in running after shutting off the petrol is that in the ordinary way the petrol level is too high; after the supply has been stopped the level, of course, becomes lower. You should have the level lowered very slightly, or you might try fitting a slightly smaller jet, which would possibly give the same result and not interfere so much with the starting as altering the petrol level.

## Loss of Power.

**?** I have a 1914  $2\frac{1}{2}$  h.p. two-stroke two-speed bicycle purchased new in August, 1914. It has run a distance of 4,400 miles since then, but care has been taken of it. It has been little used during the last year, but I have had a good deal of trouble, having had a new piston and connecting rod. It now lacks power. On the flat it is a struggle to get along if there be much head wind, and on a slight gradient I have to change down. The compression is excellent. When warmed up it fires regularly and without four-stroking. The spark is adjusted in the same way as of old; but experiments in altering it have not improved matters. The carburetter takes full air, and it must be good, otherwise it would four-stroke or misfire. Different adjustments have been tried. The engine always sounded rather "puny," but I think there is now even less "bark." Can you suggest any reason for the lack of power? Is it merely old age? The compression being so good makes it difficult to understand.—S.T.F.

We think the most probable cause of your trouble is choked exhaust outlet. This trouble is frequently the cause of trouble on two-strokes. See that the silencer is quite clear, also tail pipe. In view of the fact that you say all other points are in order, this seems to be the only possible cause, unless the new piston is not correct in design. If clearing the silencer and exhaust outlets does not effect a cure you might remove the cylinder and see that the rings are free and in good order.

A detachment of motor cyclists of the Armoured Car Section. The photograph was taken in Egypt, and shows the riders all mounted on Triumph W.D. models.

**A Scored Cylinder.**

I have a 1913  $2\frac{3}{4}$  h.p. horizontal twin. The insides of both cylinders have been scored by the thin end of the gudgeon pins to a depth of about 1 mm.

This means that I can get no power out of the machine at all. (1.) Would it be sufficient to have the cylinders reground? (2.) Or would you advise me to send it to a firm of oxy-acetylene welders? (3.) How can I prevent the gudgeon pins from again scoring the cylinders?—G.P.

(1.) It will be necessary to have the cylinders reground, in which case you will require new pistons as well. (2.) This is hardly a job which could be cured by acetylene welding. (3.) At each end of the gudgeon pin, we believe, there are brass caps, which are in position for the purpose of preventing the cylinder being scored.

**Two Sparks.**

How can two sparks be got in each cylinder from a Bosch magneto, Z.E. type?—C.B.C.

Really the only practical method of obtaining two sparks per cylinder is by the use of a double pole plug. This is screwed into the usual plug hole. Another ordinary plug should be fitted into the cylinder head or any other convenient position. The high-tension wire is then taken from the magneto to the double pole plug, and a wire from the second plug terminal is then taken to the ordinary plug. Two instantaneous sparks are thus obtained, but this system is likely to cause difficult starting unless the double pole plug is cut out and switched in after a start has been made. Two sparks can be obtained by the introduction of a condenser in the high-tension circuit, but we do not think this method is so satisfactory as the double pole plug.

In view of recent illustrations in *The Motor Cycle* of Autopedes and motor skicycles, the photographs reproduced are of interest. They depict a pair of motor skates, the invention of a Frenchman, who made them ten years ago. Each skate has four wheels and a separate single-cylinder air-cooled engine.

**Swivelling Lamps.**

Will you kindly state exactly what is meant by a "swivelling lamp," which when used by a motor cyclist renders him liable to be fined, also to have his

lamps confiscated?—J.H.T.

A swivelling lamp is one which, by loosening certain nuts, is capable of being moved, or swivelled, independently of the movement of the machine, without actually removing it from the bracket in which it is normally held.

**Oil Leakage.**

The lower part (that is, in the neighbourhood of the crank case) of my  $2\frac{3}{4}$  h.p. two-stroke gets very much covered with oil.

Does this mean that there must be a leak between the cylinder and crank case? The part of the magneto nearest the engine also gets very oily. Is this to be expected or not? Would this mean a loss of much power? If a new joint of brown paper were made, would this stop all oil from leaking? One needs all available power on a small horse-power machine, and I should be glad of your advice in the matter.—H.B.T.

If your two-stroke is lubricated on the petroil system you need not be surprised that the crank case and everything else is enveloped in oil. If, however, the oil is led direct to the crank case, then there must obviously be a leak. This should not be the case, as if there is a leak you are losing crank case compression, and, consequently power. A new brown paper washer might cure the trouble.

**Tuning for Reliability and Speed.**

My mount is a 1916  $4\frac{1}{2}$  h.p. single, and I only use it for pleasure. I want some advice about tuning it for reliability trials, speed, or hill-climbing competitions. (1.) Will it increase the speed to drill the piston? (2.) Will this upset the balance and cause excessive vibration, as the makers recommend removing the bottom ring? (3.) Will you give me instructions for timing the valves? (4.) Do you recommend overlap? (5.) What grade of oil would you use—heavy, medium, or light?—J.U.

We would recommend you, if you desire to obtain generally good all-round results from your machine, consistent with reliability, not to make any very drastic alterations, but merely to make sure that all the adjustments are correct, and that the machine generally is clean, well oiled,

etc. Have as few accessories as possible fitted.

(1.) If properly done by an experienced engineer, and the engine balance corrected, an increase of speed is possible. (2.)

Yes; the balance would be affected, and should be corrected. (3.) The best valve timing can only be arrived at by experiment, and, unless

you intend to use your machine solely for racing, we should advise you to retain the standard setting, as recommended by the makers. (4.) We

would not advise overlap, except for racing or fast hill-climbing. (5.) Use an oil of well-known make; the thinner the oil, consistent with high flash point, the better.

**Tricar Licences.**

Will you kindly tell me if a tricar can be kept with a £1 motor cycle licence, and if it can be driven with a motor cycle licence?—J.W.J.

Yes, a tricar is considered to be a motor cycle as far as the law is concerned. The local taxation licence is £1 per year. It can be driven with a motor cycle licence; that is, the driver need only be fourteen years of age. If under 3 cwt. the registration numbers cost 5s.; if over 3 cwt., car numbers have to be used, which cost £1.

**Flat-faced Valves.**

(1.) Would you please forward particulars as to differences of flat valves and  $45^\circ$  valves? (2.) I have been troubled lately with petrol being blown back through extra air intake. If I close the air I do not get good results. I have set valves and reground them, but it makes no difference. They are both flat valves. (3.) How much clearance should piston have in cylinder diameter? My piston is a fit without rings. Would it cause overheating?—D.B.

(1.) When new there is little to choose between flat or tapered valve seatings. If anything, when new the flat seatings would be better, as they would require less lift, but directly wear sets in it is frequently difficult to get the flat-seated valve to seat properly, so in the long run the tapered seating is to be preferred. (2.) The blow back of which you complain may be due to the valve not seating correctly, weak inlet springs, or to incorrect timing. The inlet valve should not open until the piston has reached the top dead centre, and the exhaust valve has closed. (3.) The piston should be a fairly close fit, even without piston rings. On the average  $3\frac{1}{2}$  h.p. single-cylinder machine the clearance would be about  $3/1,000$  in. As a rule  $1/1,000$  in. is allowed for every inch of cylinder diameter.

**RECOMMENDED ROUTES.**

cyclists at the front is the

## STURMEY ARCHER COUNTERSHAFT GEAR

as it will be of the whole motor cycling public when it can once more be supplied for general use. The Sturmev-Archer Countershaft Gear has been tried in the fire of the war and, since the fateful fourth of August, 1914, has been "doing its bit" towards the goal of victory. For the day when that is reached make a note of the address, Sturmev-Archer Gears, Ltd. Nottingham.

# MISCELLANEOUS ADVERTISEMENTS.

## PRICES.

**ADVERTISEMENTS** in these columns—First 12 words or less 1/6, and 3d. for every two words after. Each paragraph is charged separately. Name and address must be counted. Series discounts and special terms to regular trade advertisers will be quoted on application.

Postal Orders sent in payment for advertisements should be made payable to **ILIFFE & SONS Ltd.**, and crossed **& Co.**

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor St., E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

## NUMBERED ADDRESSES.

For the convenience of advertisers letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charge. Only the number will appear in the advertisement. All replies should be addressed, "No. 000, c/o 'The Motor Cycle,' 20, Tudor Street, E.C."

## DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged, when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

## SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

## DEFENCE OF THE REALM ACT

Under the provisions of the above Act, advertisers requiring workmen, and whose business consists wholly or mainly of engineering or the productions of munitions of war, or substances required for the production thereof, and whose works are situated within 30 miles of London, must include in every such advertisement the words, "No person resident more than 10 miles away, or already engaged on Government work, will be engaged."

Advertisers whose works are situated more than 30 miles from London can only have their announcements inserted with the approval of the Board of Trade, who will allocate to each advertisement a box number, and collect and distribute to the advertiser all replies received. The necessary forms of application can be obtained from any Labour Exchange or from the offices of this paper, and each advertisement must contain a clear reference to the effect that no person already engaged on Government work need apply.

## MOTOR CYCLES FOR SALE.

### A.J.S.

A.J.S., 1915, 4½ h.p., lamps, horn, etc., excellent condition; £50, with Mills-Fulford sidecar, hood, screen, etc., £60.—Roland Winn, 8, Knighton Drive, Leicester. [4624]

## An Unsolved Problem.

**W**EATHERPROOFING is a problem which has been with us since the earlier days of the motor cycle. The question is quite forcibly brought before one's notice each succeeding winter, and from the remarks one hears by both motor cyclists and non-motor cyclists, it is clear that the lack of protection on the average motor cycle is a deterrent to many. The subject becomes quite a hardy annual, but there is nothing objectionable in that fact so long as the problem remains unsolved. It is common knowledge that many firms have devoted much time and trouble to provide adequate protection for the riders of motor cycles.

In some cases really useful fittings have been the result, but few have been standardised, as makers attach so much importance to the question of appearance, and have banned the shields as unsightly. But this question of neatness can be overdone and efficiency sacrificed. After all, a motor cycle is not exactly pretty to gaze upon, and we believe the majority of readers would stipulate efficiency and adequate protection before appearance any day.

What surprises us in particular is the refusal of most firms to standardise the admittedly efficient and simple type of shield which extends from above the footrests and sweeps under the crank case. Not only are the rider's nether limbs protected in this manner, but also the transmission system. It is highly probable that if a lead were given by one or two of the largest firms other manufacturers would quickly follow suit, but the regrettable fact remains that efficient mud shields are still absent from the average mount. We must confess that we are not in favour of half-encasing wheels to obtain cleanliness on account of the fear of clogging, and also the effect on the steering due to wind pressure; but our correspondence proves that there is a really pressing demand for a shield to ward off rain and mud from the rider's feet and legs,

and an underpan to keep down dirt scattered by the front wheel.

What is there against deflecting mud and grit which, in the ordinary course of events, coat crank case, silencer, and gear, and find their way in to the transmission system, obviously to its great detriment? The country practitioner in particular will never use the motor cycle in winter until it has been rendered weatherproof, and so amply protected that the rider need not of necessity don overalls, the fitting and removal of which constitute such a nuisance when frequent calls have to be made.

There is evidence that manufacturers specialising in sidecar outfits at any rate are devoting more attention to the question of protecting the rider's legs, as well as the working parts of the machine, and we would like to see the movement extended to solo machines. Two sidecars belonging to experimentalists which we examined the other day were remarkably well protected, and there is no valid reason why every machine should not be equally well shielded. A clean motor cycle and a clean rider are the finest advertisements the pastime could have. After the war, in order to stimulate effort in the direction under discussion, competitions must be organised with the special object of testing the efficiency of "weatherproof" shields and mudguards, and we hope that the Auto Cycle Union is alive to this crying need.

In the meantime, we direct attention to an article in this issue by Dr. René Camus, of the French Army, who, in an attempt to solve the problem, takes the bull by the horns and designs the whole machine with an eye to protection from mud and water.

Dr. Camus's idea is to enclose the whole of the engine mechanism and protect it from the elements by aluminium plates. This arrangement necessitates the fitting of a blower to assist the cooling process. After all, there is no reason that, with the present reliability of a motor cycle engine, all the vital parts should be exposed.

## In the Zone of the Fiercest Fighting.

Photographs taken near Verdun, the scene of the recent great French Victory.

It will be recollected that the Germans approached to within three or four miles of Verdun in their great attack, which commenced in the spring and lasted until July. Up to the time of the Allies' great attack on the Somme, the intensity of the fighting which occurred in front of this city had never been equalled on any front during the war; it even eclipsed Ypres in the persistency and tenacity of the attacks and repulses. A month ago the news was flashed throughout the world (with the exception of Germany and Austria) that the French had swept the Germans back from the famous fort of Douaumont, and also recovered in a few days ground which had cost the Germans months of fighting and thousands of lives to gain. The French victory was one of the most dramatic that has occurred on the Western front.

IT is not usual for photographs taken so close to the fighting line to be passed by the Censor, and these, which have been passed by the Ministère de la Guerre, have in consequence an added interest. They show well the terrible damage done by the Boches.

In No. 1 a passage is shown leading beneath a bridge on the Meuse, which is quite in view of the enemy—an "unhealthy" spot we should say—and one on which no one is allowed in daylight.

In No. 2 will be seen the beautiful and famous River Meuse,

which flows by the scarred banks of the city, the cathedral showing in the distance. No. 3 also shows a distant view of the cathedral, and the photographer's Triumph in the foreground.

No. 4 is a general view of the graceful little town, and might well be taken for a peaceful English scene, and in this instance the photograph does not suggest the brooding horror that hangs over the city. No. 5 shows a despatch rider at the headquarters of artillery.

The ruthless damage of the churches is portrayed in No. 6, and No. 7 also depicts the abject desolation seen from a bridge after a terrific bombardment.

The sender of these exclusive pictures is H. E. Plateau, E.M., and it will be noticed that a foot-controlled gear is fitted to his Triumph machine in place of the standard arrangement.

These photographs have been approved by the French Ministère de la Guerre.

## Occasional Comments

"By Ixion"

### More Motor Cycling Missionaries.

A parson tossed me a missionary report the other day. Such reports are often dull documents, but he drew my attention to the fact that some of the clergy working new districts of large area under the "Archbishops' Western Canada Fund" are using Indian motor cycles for their rounds. As the men concerned are English curates on loan from English parishes, I rather wonder they don't use English machines; perhaps the rear sprung Indian frame is concerned in the answer, as the roads are probably the limit. Anyhow, as one would expect, the clerical riders seem uncommonly pleased with the Indian, and as those of them who don't use motor cycles perform their lengthy Sunday trips on ponies or on Ford cars, I imagine the ministers with the most scattered districts get the motor bicycles. They apparently preach about four times a Sunday, and I expect the rides freshen them up considerably for the final service of the day. It must be a nice question whether over winter surfaces they really prefer the pony, the car, or the motor cycle as a means of locomotion.

### Twin Inlet Pipings.

I asked the other day when any motor cyclist could honestly say a good word for the type of inlet pipe union employed on his twin-cylinder, my own experience being that it is almost uniformly difficult to make airtight when once disturbed. In fact, it is quite the routine in some garages to swathe the unions of such machines with insulating tape when an owner comes in with complaints of bad running, and many of the knowing amateurs have long since adopted the tip even with new models; I had to apply it to a certain 1916 twin when I called to take delivery of it at my nearest railway station; it would not start till the leaks had been caulked, despite a complete union with compressible washers inside it. My challenge evoked one reply, relating to a machine which I never rode—the old Premier V twin. This had a split cone sliding on the two ends of the inlet pipe, and the female locking ring was also coned internally. The cone and ring necessarily centred each other, as the ring drew up the thread on the engine stub, and the device is obviously sound.

A sound device for obtaining an airtight inlet pipe union on twin-cylinder motor cycles.

### Overheated Sparking Plugs.

An eminent plug maker informs me that the overheating of sparking plug electrodes does not depend so much as I had fancied on the thickness or thinness of the points as on the surface area exposed to the flame of the explosion. He considers that the ideal plug is one with an electrode exposing the minimum surface area to the flame in proportion to its powers

of heat conductivity. A thick and highly exposed electrode may absorb more heat than its stem can conduct away in time, and the ideal sparking gap (as a preventive of overheating) would consist of two cones with only their tips exposed, supposing proper arrangements could be made for conducting away heat through their bases. (This looks as if my old claim for bigger plugs were sound!) Many plugs are spoilt by having their electrodes riveted or brazed to their foundations, a joint which always interferes very seriously with conductivity. Similarly, it is bad practice to terminate the insulator as a cone surrounding the central electrode; the cone absorbs the maximum amount of heat, and transfers it by conduction into the stem of the electrode, which is already overcrowded, so to speak, with heat attempting to escape from its tip. But if the insulator ends in a hollow cone, the heat is conducted into the screw-threaded portion of the body, which never shows any signs of having been overheated. But the real crux of plug making occurs when the designer is asked to make a reliable plug for an oily engine which is also a terrific "revver," for the cure of sooting is the cause of overheating, and the plug which can burn its points clean is also the plug which has been designed not to keep cool!

### The Choked Jet Factor.

One trade magnate told me frankly that he would have fitted a certain rather expensive automatic carburettor to all his machines three years ago but for the mugs who compose so large a percentage of his customers. He explained that his standard carburettor was extraordinarily simple to tackle. If it needed a different jet, or if the jet choked, a single spanner and a little care in tightening a light brass part down on to a fibre washer was the only work entailed. But each year brought him many angry letters and many returned parts, because so many buyers are incapable of performing such a simple job accurately. He felt that if he fitted a comparatively complex vappriiser with several petrol joints and several small and flimsy parts, he would be asking for trouble with his customers, and he was very probably right. The corrective lies in a study of motor car practice. All European motor cars are equipped with complex carburettors composed of delicate parts, and it is the exception for a motor car manufacturer to be bothered by silly customers in this way, simply because his carburettor is carefully adjusted prior to delivery, and is further adequately protected from the ingress of dirt. As it gives no trouble, the owner does not tinker with it. If motor cycle designers fit proper strainer gauzes to their tanks, proper filters to their supply pipes, and efficient dust screens to their air intakes, their customers will be more likely to leave the carburettor undisturbed; and in that case there will be less difficulty in adopting carburettors having many delicate parts.

# THE ALL-WEATHER MOTOR CYCLE.

How to Produce a Motor Cycle which shall be Clean in all Weathers.

By Dr. René Camus, Médecin Chef, French Army.

**A**S will be generally agreed, one of the improvements most important to effect in order to make the motor cycle a really practical thing is to obtain cleanliness. At present, from the point of view of the mechanism and road qualities, the motor cycle may be considered really efficient. Almost the only requirement left unsatisfied is the highly important one of adequate protection. The question, therefore, is how to construct a machine which will carry its rider over the road without gathering up and depositing upon his clothes the dust or the mud of the roadway, and whose engine, apart from its usefulness as a means of propulsion, ceases to throw over the clothes of the rider the oil which he innocently poured into the tank.

The problem appears simple enough at first sight, and one easy to solve with proper mudguards and an oil-tight engine. But the engine needs a current of air, and where air passes during running, mud and dust also pass. Also, however oil-proof the engine may be, sooner or later it will get an immoderate amount of oil, and some of this will exude. In my opinion, therefore, in order to remedy these two faults it is necessary to be able to enclose the engine completely in a case, and to provide for its cooling by other means than the current of air while running. Water-cooling would be ideal if it were not heavy, but why not employ air-cooling with a suitable blower? In this manner our clean motor cycle may be produced. The designs herewith give an idea of it.

## A Detachable Unit.

For the frame I use a model recalling the Scott frame, which is a marvel (as is all the rest of the machine), but modifying it as necessary and in such a way that all the mechanical block, engine, gear box, etc., can be withdrawn from the frame without dismounting any essential part. Fig. 1 represents the frame alone, without wheels or engine. Fig. 2 the little accessory frame in which the power unit is mounted. Thanks to this arrangement all the machinery is contained in a limited space by upright metallic pieces forming a kind of skeleton case, which can be closed by aluminium plates, thus allowing an easy and frequent inspection.

In this little frame will be mounted, fixed upon the front tubes, the inclined engine, having before it the magneto and carburetter; at the back will be placed the gear box below and two ventilators conveying the air over the cylinder through two tubes issuing from

each side of the cylinder. Whatever may be the type of engine, two or four-stroke, the cylinder wings will be placed in the direction of the current of air.

As is shown by fig. 3, the engine, the two ventilators (whose axle is common), and the gear box are united

Fig. 3.—Showing the ventilator and air pipe.

by the same chain passing over three pinions. Another chain drives the magneto. The petrol and oil tanks will be fitted in the front part of the frame above the engine unit.

With the complete mechanism entirely enclosed in a case, the only openings are the two circular orifices at the back on the right and left by which the ventilators take in the air, and the orifices at the right and left through which the warm air passes. We have thus obtained a rigidly constructed frame, an engine, sheltered from rain, mud, and dust, from which the oil will not be thrown upon the rider.

## The Mudguarding.

Now it is necessary to protect the motor cyclist against the mud and dust of the road. As we no longer have to arrange for a passage for cooling the engine we can place the mudguard in a better position and just as we wish. In order to obtain efficient protection, we must know the manner in which the mud is thrown. Besides that due to the centrifugal force of the wheels, there is the mud which is splashed up under the front and back tyres, to right and left. In order to stop this, the wheel must be surrounded at two-thirds of its circumference by a flat mudguard, very large, about three times the diameter of the tyre (fig. 4). The lateral walls (side valances) of the actual mudguard serve but little to retain the thick mud, and they may be discarded. The mud coming from the back tyre would be stopped by the protectors doing duty as footrests as in the Scott (fig. 5). The mud which is thrown up sometimes in the front above the

Fig. 4.—Unconventional mudguards of sensible size and design.

Fig. 1.—The framework of a suggested design by Dr. René Camus, of the French Army.

Fig. 2.—The auxiliary frame in which the power unit is mounted.

**The All-weather Motor Cycle.—**

mudguard will be avoided by extending this forward. The mud thrown under the machine will be stopped by the footrests, which will cover all the lower part of the frame.

Fig. 5.—Rear mudguard and footboard, an arrangement which would appeal to Colonial riders.

Up to now very little has been said about the mud thrown by the rear wheels. That, however, must not be neglected. We shall stop this mud as in the case of the front wheel with a large flat mudguard without lateral walls, but getting larger at the front where it joins the footrests.

It seems to me that with a machine thus made one could drive without any fear of getting dirty. In addition it is easy to understand that suggestions of the type described here can be easily improved further so as to produce a machine very nearly approaching the ideal. The system of protection against mud does not prevent the use of the most modern carriers, supports, etc. In short, the enclosed engine, cooled by a strong current of air, whether in hill-climbing, running slowly, or travelling at speed, will give equally satisfactory results as the present type of air-cooling system.

Dr. Camus's complete mud-proof motor cycle of quite revolutionary design.

## ANOTHER MINIATURE MOTOR CYCLE.

FROM time to time additions to the number of "motor scooters" or "auto-ped cycles" make their appearance, usually emanating from U.S.A., but the latest invention of this type is from an English source, the patentee being Mr. E. V. Hammond, 88, Louisville Road, Balham. The water-cooling system forms the frame, a cylindrical tank or radiator supports the steering column, and the flow and return pipes, from a water-jacketed two-stroke engine, make up the triangular frame. Mud-shields are provided in front, in one with the footboards, and a glass windscreen is fitted in front of the steering wheel, which is preferred to handle-bars. Truly it is a quaint contrivance, and, despite its novel features, one cannot help smiling at the prospect of such a machine ridden by a tall man. The inventor is bent upon keeping the rider warm at all costs, the saddle being clipped on to the rising hot water tube, but this

A novel "motor scooter" with a water-cooled engine and friction drive. Are we soon to see staid city men tobogganing along the highway on mechanical "auto-peds"? The sight would certainly be entertaining.

is counteracted by the absence of a back mudguard; thus whilst the rider's knees and legs are being well toasted, his back will be subjected to an ever increasing poultice of cold mud. We presume petrol is the motive power, but there is no provision in the specification for the tank or oil.

Springs are not forgotten, although it may appear so from the illustration, but a cunning device embodies springs inside the front forks. Friction drive on a tyre tread will slip directly wet roads are encountered, and so provision is made for pulling the back wheel into harder contact with the driving pulley when necessary.

It is an exceedingly ingenious machine, but whether it will prove efficient is very doubtful,

and, even so, whether members of the British public will go tobogganing about our streets and roads, somewhat after the manner of the comic trick cyclist of the music halls, is quite another matter.

## WAR TIME ROAD DESTRUCTION.

MANY of our fine main roads have during the last two years deteriorated to an alarming degree. The bad conditions are generally attributed to the increased amount and heavier nature of the traffic occasioned by the war and the lack of labour for repairing. This is, of course, correct to a certain extent, but the damage done could be reduced by fully 50% if the proper speed limit of 12 m.p.h. for the heavy war lorries were rigidly

enforced. During a recent week-end run one of our staff encountered several 3 ton war lorries on a famous main road, now notorious for its atrocious surface, being driven at speeds varying from 18-30 m.p.h. This reckless driving is undoubtedly the prime cause of the extra destruction of the road surfaces. In addition to the damage to the roads, this speed cannot possibly be good for the springing and vital parts of the lorries themselves.

## Lamps Lighted from the Magneto.

A Device which gives Sufficient Light to comply with the Lighting Regulations.

THE question of lighting by means of the current from a magneto has been discussed on more than one occasion in these columns. Various devices have been described and illustrated by which the magneto has been utilised to illuminate a tail lamp.

A few days ago we inspected the F.R.S. magneto lighting set fitted to a 2½ h.p. twin Douglas. It is claimed for this set that quite sufficient continuous

ing. At slow speeds the magneto does not provide a sufficiently strong current to light the lamp and at the same time start the engine.

The amount of light derivable from the magneto depends on the size of the magneto machine and the speed at which it revolves. This set, although more suitable for high-speed engines, because of the engine speed, has been used on a 3½ h.p. Triumph. Three wires come out of the coil box, one going to each lamp and one to the magneto cut-out terminal. The special bulbs used are very small and provided with metallic filaments. As an instance of the amount of light given by the head lamp with only a flash light bulb, Mr. F. R. Swinburne told us that it was sufficient to draw the attention of the police, who insisted upon the lamp being screened with paper. One of these lighting sets has been in use on a Douglas machine for forty miles a day (using the light during daylight for the purpose of a test) for eighteen months.

The complete set comprises head lamp and handle-bar brackets, tail lamp to fit number-plate, the box containing the converting coil and dry battery switch, spare bulb and all wiring, and is sold at 65s., nickel-plated or ebony black. The size of the head lamp is 6in. face with a 5in. glass, and the box measures 6in. long by 3½in. deep by 3in. wide. Mr. F. R. Swinburne is most enthusiastic concerning the possibilities of this method of lighting, and told us that, although he would always use a more powerful light for long night journeys, it was just the thing for short trips.

F.R.S. magneto-lighted head and tail lamp. The box on the top tube contains a special coil, three-way switch, and dry battery. The third wire is connected to the magneto switch terminal.

current is produced for a head light and tail light for all ordinary purposes under the lighting restrictions and at touring speeds. The only addition is a small wood box attached to the top tube. This contains a coil for converting the magneto current into a suitable one for lighting bulbs, and a dry battery for use while the machine is stationary and for start-

### Battery-lighted Sets.

The makers of this novel form of lighting are also marketing the F.R.S. battery lighting sets. One of these sets we illustrate, consisting of a 7in. head lamp with a 5½in. glass, handle-bar fittings, egg-shaped sidecar lamp, and ball-shaped tail lamp. The complete set, with accumulator case 8in. by 5½in. by 5in., costs £5 10s. A smaller set, but without the sidecar lamp, is £4 8s. These lamps have four-volt four candle-power bulbs and adjustable focus.

Still another device of great service during restricted lighting is an adapter

F.R.S. battery-lighted lamp set for use on sidecar combinations. The set consists of handle-bar bracket, head, side, and tail lamps, accumulator in wood case, switch, and wire.

for converting an ordinary gas head lamp to an electric one. This consists of a flash lamp bulb fitted to a clip which slips over the acetylene burner, the bulb facing the lens reflector, and the wire which connects it to the battery passing through one of the holes in the bottom of the lamp. The adapter, complete with accumulator in a leather case, and the necessary wire to connect it up, costs £1.

## Water-cooled Sparking Plugs.

THE subject of efficiently cooling sparking plugs has many times been brought forward in *The Motor Cycle* and caused a considerable amount of interest. Two readers have submitted designs which they have tried and found most satisfactory. The first is one sent by Cpl. H. Ramsey, who is a fitter attached

to an A.S.C. company in France. He tells us that, owing to inferior fuel, they had been experiencing considerable plug trouble, due to overheating. He accordingly had a special plug made with a water jacket, which, as will be noticed from the illustration, encases the whole metal body of the plug and a considerable length of the insulator. An inlet and an outlet are provided at the top and bottom of the jacket, and are connected by means of copper tube to a small water tank arranged in any convenient position in the frame of the machine. Cpl. Ramsey has tried two of these plugs in a Clyno outfit, which runs seventy to eighty miles regularly every day, and the results have proved quite satisfactory.

### A Still More Simple Device.

A somewhat simpler design is the one sent by Mr. G. W. Perian. This is merely a cup designed to take the place of the copper asbestos washer of an ordinary plug, so that when the plug is screwed into position the body of the plug is practically standing in a metal bowl. Into this bowl water is dripped from a small tank attached in any convenient position.

A war zone method of water-cooling the sparking plug.

Another device easily made for keeping the plug cool.
